# KEY TO PRONUNCIATION.

a as in fat, man, pang.  
 ā as in fate, mane, dale.  
 ā as in far, father, guard.  
 ă as in fall, talk, naught.  
 ą as in ask, fast, ant.  
 â as in fare, hair, bear.  
 e as in met, pen, bless.  
 ē as in mete, meet, meat.  
 ě as in her, fern, heard.  
 i as in pin, it, bisuit.  
 ī as in pine, flight, file.  
 o as in not, on, frog.  
 ō as in note, poke, floor.  
 ô as in move, spoon, room.  
 ô as in nor, song, off.  
 u as in tub, son, blood.  
 ŭ as in mute, acute, few (also new, tube, duty : see Preface, pp. ix, xi).

û as in pull, book, could.  
 u German u, French u.  
 oi as in oil, joint, boy.  
 ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus :

ĭ as in prelate, contrage, captain.  
 ĕ as in ablegate, episcopal.  
 ŏ as in abrogate, eulogy, democrat.  
 ŭ as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that,

even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). See Preface, p. xi. Thus :

a as in errant, republican.  
 e as in prudent, difference.  
 ĭ as in charity, density.  
 o as in valor, actor, idiot.  
 ū as in Persia, peninsula.  
 ĕ as in the book.  
 ŭ as in nature, feature.

A mark (˘) under the consonants *t, d, s, z* indicates that they in like manner are variable to *ch, j, sh, zh*. Thus :

t as in nature, adventure.  
 d as in arduous, education.  
 s as in pressure.  
 z as in seizure.

th as in thin.  
 th as in then.  
 ch as in German ach, Scotch loch.  
 ñ French nasalizing n, as in ton, en.  
 ly (in French words) French liquid (mouillé) l.  
 ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

## SIGNS.

< read *from* ; i. e., derived from.  
 > read *whence* ; i. e., from which is derived.  
 + read *and* ; i. e., compounded with, or with suffix.  
 = read *cognate with* ; i. e., etymologically parallel with.  
 √ read *root*.  
 \* read *theoretical or alleged* ; i. e., theoretically assumed, or asserted but unverified, form.  
 † read *obsolete*.

## SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus :

back<sup>1</sup> (bak), *n.* The posterior part, etc.  
 back<sup>1</sup> (bak), *a.* Lying or being behind, etc.  
 back<sup>1</sup> (bak), *v.* To furnish with a back, etc.  
 back<sup>1</sup> (bak), *adv.* Behind, etc.  
 back<sup>2†</sup> (bak), *n.* The earlier form of *bat*.  
 back<sup>3</sup> (bak), *n.* A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "st." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan :

Section only ..... § 5.  
 Chapter only ..... xiv.

Canto only ..... xiv.  
 Book only ..... iii.  
 Book and chapter ..... }  
 Part and chapter ..... }  
 Book and line ..... }  
 Book and page ..... } iii. 10.  
 Act and scene ..... }  
 Chapter and verse ..... }  
 No. and page ..... }  
 Volume and page ..... II. 34.  
 Volume and chapter ..... IV. iv.  
 Part, book, and chapter ..... II. iv. 12.  
 Chapter and section or ¶ ..... vii. § or ¶ 3.  
 Volume, part, and section or ¶ ..... I. i. § or ¶ 6.  
 Book, chapter, and section or ¶ ..... I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discriminated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoological and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoology, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoological and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

**M** represents a labial nasal sound, the corresponding nasal to *b* and *p*, as *n* to *d* and *t*, and *ny* to *g* and *k*. That is to say, in its production the lips are pressed together, or form a mute closure, as in *p* and *b*, and the vocal chords are set in sonant vibration, as in *n*; but the passage from the pharynx into the nose is open, so that the tone rings in the nasal as well as in the oral cavity, and this gives the peculiar quality which we term nasal. (See *nasal*.) Since the nose is incapable of complete closure (except by external means, as the fingers), the sound thus produced is resonant and continuant, and hence *m* and *n* are ordinarily reckoned as semivocal, or liquid, or the like. But *m* does not win, like *n*, an actual vowel value in English syllabification: though in vulgar pronunciation words like *elm*, *spasm*, etc., are sometimes resolved into *el-un*, *spaz-un*, etc. The sound *m*, especially as initial, is a very stable element in Indo-European language-history: compare *manai*, *naiad*, Latin *maius*, Greek *μεγας*, Sanskrit *yama*; or *mother*, oldest traceable form *matar* (compared with the altered *father*, brother, oldest *patar*, *bhratar*). *M* has no varieties of pronunciation, and is silent only in a few foreign words, as *mnemonic*; it is doubled under the same circumstances as the consonants in general, as in *dimmer*, *dimming*, *dimmed*, etc., from *din*.

2. As a numeral, in the Roman system, *M* denotes 1,000. With a dash or stroke over it (*M̄*), it stands for a thousand times a thousand, or 1,000,000.—3. As a symbol: (a) In the mnemonic words of logic (see *mood*<sup>2</sup>), *m* indicates a transposition (metathesis) of the premises in the reduction. (b) Formerly, *M* was a brand impressed on one convicted of manslaughter and admitted to the benefit of clergy.—4. As an abbreviation: (a) In titles, *M* stands for *Magister* or *Master*, as in A. M.; for *Medicina* or *Medicine*, as in M. D.; or for *Member*, as in M. C., member of Congress, and M. P., member of Parliament. (b) In *mech.*, *m* stands for *mass*. (c) In dental formulæ, in *zool.*, *m* stands for *molar*, and *dm* for *deciduous molar*. (d) In *math.*, *M* or *μ* stands for *modulus*; in *higher geom.*, *m* or *μ* for the degree of a curve. (e) In *astron.* and *metrol.*, *m* stands for *minute* (of time), and for *meter*; *mm* for *millimeter*; and *μ* for *micron* or *micromillimeter*. (f) In *musical notation*, *M* stands for *mano* (*main*), *mezzo*, *metronome*, and in organ-music for *manual*. See *M. D.*, *M. M.*, *M. S.* (g) In a ship's log-book, *m* is an abbreviation of *mist*.—5. In printing, the square or quadrate of any body of type: more commonly spelled out, *em* (which see).—To have an **M** under (or by) the girdle, to have the courtesy of addressing by the title Mr., Miss, Mrs., etc.; show due respect by using the titles Mr., Mrs., etc. (Colloq.)

Miss. The devil take you, Neverout! besides all small curses.

Lady A. Marry, come up! What, plain Neverout! me thinks you might have an **M** under your girdle, miss.

**Maba** (*mā'bā*), *n.* [NL. (J. R. Forster, 1776), the name of the plant in Tonga-Tabu.] A genus of dicotyledonous gamopetalous plants belonging to the natural order *Ebenaceæ*, the ebony family, characterized by dioecious flowers, almost always three-parted, from three to an indefinite number of stamens, and three styles, sometimes united below. They are shrubs or trees, usually of very hard wood, with small entire leaves, and flowers either solitary or in cymes. Fifty-nine species are known, natives of the warm regions of the globe. The ebony-wood of Cochinchina and Coromandel is believed to be the product of a tree of this genus. *M. geminata* and *M. laurina*, called *Queensland ebony*, furnish, with other species of the region, desirable substitutes for ebony. *M. buxifolia* has been called *East Indian satinwood*. The genus is found in a fossil state in many Tertiary deposits, the fruiting exdys on its peduncle being all that is usually preserved. Eight species are thus known. They have been described under the name *Macrophylla*, now regarded as a section of *Maba*. One of these fossil species occurs in Colorado.

**mabbler**, *v. t.* A variant of *moble*<sup>2</sup>.

**mabby** (*mab'i*), *n.* [Formerly also *mobby*; Barbados.] A spirituous liquor distilled from potatoes in Barbados.

**Mac**. [< Gael. *mac* = Ir. *mac* = W. *map*, *mab*, also *ap*, *ab*, a son, = Goth. *maqus*, a son; see *may*<sup>2</sup>. Cf. *ap*.] An element, usually a conjoined prefix, in many Scotch and Irish names of Celtic origin, cognate with the Welsh *Ap*, signifying 'son,' and being thus equivalent to the Irish *O'*, the English *-son* or *-s*, and the Norman *Fitz*. The prefix is either written in full, *Mac*, or abbreviated to *Mc* or *M'*, which in works printed in the British Isles almost invariably appears as *M'*—the contracted form being followed by a capital letter, while *Mac* takes a capital after it but rarely. Thus a name may be variously spelled as *Macdonald* (rarely *MacDonald*), *M'Donald*, or *McDonald*; so *MacKenzie*, *M'Kenzie*, or *McKenzie*, etc. In catalogues, directories, etc., names with this prefix, whether written *Mac*, *M'*, or *Mc*, are properly entered in the alphabetical place of *Mac*. Sometimes used separately for persons whose names begin with this prefix.

The Fitzes sometimes permitted themselves to speak with scorn of the O's and Macs, and the O's and Macs sometimes repaid that scorn with aversion. *Macaulay*.

**Macabresque** (*ma-kā-bēr-esk'*), *a.* [< *Macabur* (see *def.*) + *-esque*. Cf. ML. *Machabæorum chora*, as if the 'dance of the Maccabees.'] Pertaining to or of the character of the so-called 'Dance of Death,' a favorite subject in the literature, art, and pantomime of Europe in the middle ages and early Renaissance; apparently based on a series of dialogues of death attributed to Macabur, an old German poet of whom nothing is known. See *dance of death*, under *dance*.

**macaco**<sup>1</sup> (*ma-kā'kō*), *n.* [Formerly also *manacaco*, *macark*; from a Malagasy name.] 1. The ring-tailed lemur or cat-lemur, the species of *Lemur* earliest known, described under this name by Buffon; the *L. catia* of Linnaeus.—2. The technical specific name of the ruffed lemur, *L. macaco*. Hence—3. Any lemur; a maki.—

4. The so-called yellow lemur or kinkajou, *Cercopithecus cadrobrutus*; a misnomer. See *ent* under *kinkajou*.

Cuvier) (*Macaca*, Lacépède, 1801), < F. *macaque* (Buffon), from a native name, *macaco*; see *macaco*<sup>2</sup>.] A genus of Old World catarrhine monkeys of the family *Cercopithecoidea* or *Cynopithecoidea*; the macaques. The genus formerly included monkeys between the *Simiina* (*Simiina*) and the *Baboina* (*Baboina*) (*Cynocephalus*). It was next restricted to species inhabiting the East Indies, having cheek-pouches, ischial callosities, and a fifth tubercle on the back molar, such as the wanderoo (*M. silenus*), the bonnet-macaque (*M. silenus*), the rhesus monkey (*M. rhesus*), the common toque (*M. cynomolgus*), etc. It is now restricted to species resembling the last-named. The leading genera which have been dissociated from *Macacus* are *Cercopithecus*, *Inuus*, *Theropithecus*, *Cynopithecus*, and *Cercopithecus*.

**macadam** (*mak-ad'am*), *n.* [Short for *Macadam pavement*; see *macadamize*.] Macadamized pavement.

There are many varieties of pavement in London, from primitive *macadam* to the noiseless asphalt.

Contemporary Rev., LIV, 432.

**Macadamia** (*mak-ā-dā'mi-ā*), *n.* [NL. (F. von Müller, 1857), named after one *Mac Adam*.] A genus of dicotyledonous apetalous plants belonging to the natural order *Proteaceæ* and the tribe *Grevilleæ*, characterized by having two pendulous ovules, seeds with unequal and fleshy cotyledons, anthers on short filaments inserted a little below the lamina, and a ring-like four-lobed or four-parted disk. There are two species, found only in eastern Australia. They are tall shrubs or trees with whorled leaves, either entire or serrate, and flowers pedicellate in pairs, in terminal or axillary racemes, the pedicels not connate. *M. ternstroemia* is the Queensland nut-tree, a small tree with dense foliage, a firm, fine-grained wood, and an edible nut with the taste of hazel, an inch or more in diameter.

**macadamization** (*mak-ad'am-i-zā'shon*), *n.* [*macadamize* + *-ation*.] The process of laying carriage-roads according to the system of John Loudon Macadam, a Scottish engineer (1756–1836), who carried it out very extensively in England. In the common process, the top soil of the roadway is removed to the depth of 14 inches. Coarse cracked stone is then laid in to a depth of 7 inches, and the interspaces and surface-depressions are filled with fine cracked stones. Over these as a bed is placed a layer 7 inches deep of road-metal or broken stone, of which no piece is larger than 2½ inches in diameter. This is rolled down with heavy steam or horse-rollers, and the top is finished with stone crushed to dust and rolled smooth. Also spelled *macadamisation*.

**macadamize** (*mak-ad'am-iz*), *v. t.*; pret. and pp. *macadamized*, ppr. *macadamizing*. [*Macadam*, the name of the inventor, + *-ize*. The F. *macadamiser* is from E.] To cover (a road or path) with a layer of broken road-metal. See *macadamization*. Also spelled *macadamise*.

**macaque** (*ma-kak'*), *n.* [*Macaque*, < *macaca*, *macaqua*, a native name; see *macaco*<sup>2</sup>, *Macacus*.] A monkey of the genus *Macacus*; one of the several kinds of monkeys coming between baboons and the African mangabays. The term has undergone the same restriction of meaning as *Macacus*; and most of the macaques, in a former sense of the word have received special names. The Javan macaque, *M. cynomolgus*, with bushy brows and tail about as long as the body, is a fair example of the arboreal forms. The mungia, *M. sinensis* of India, is known as the bonnet-macaque, from the top-knot which parts in the middle. The hinder, or rhesus macaque, *M. rhesus*, is a very common Indian species. The bunt, or pig-tailed macaque, *M. m. sinensis*, is a long limbed form inhabiting the Philippines, with the tail of moderate length. In the Borneo black

macaque, *M. maurus*, the tail is a mere stump. Some of these monkeys reach the snow-line in Tibet, as *M. thibetanus*. A remarkable species, the wanderer, *M. silenus*, with a tufted tail and the face set in an enormous frill of long gray hair, inhabits Malabar. Sometimes spelled *macake*.

It is a large and wide-spread genus, occurring abundantly in Europe and America. *M. liturata* is the tawny-barred angle of English collectors, to whom *M. notata* is known as the small peacock-moth. (c) A genus of ladybirds or coccinellids, confined to South America, having the third and fifth joints of the antennæ very small. Also *Macaria*. *Dejean*, 1834.

The word *macarize* has been adopted by Oxford men who are familiar with Aristotle, to supply a word wanting in our language. "Felicitate" and "congratulate" are (in actual usage) confined to events. . . . It may be said that men are admired for what they are, commended for what they do, and *macarized* for what they have.

Cf. *macaroni*, from the same source. In ref. to the secondary uses of the word (cf. *It. maccherone*, now *maccherone*, a fool, blockhead), it is to be noted that it is common to name a droll fellow, regarded as typical of his country, after some favorite article of food, as *E. The same material, called *Italian paste*, is also made into a thread-like product called *vermicelli*, and into sticks, lozenges, disks, ribbons, etc. Macaroni, cooked in various ways, constitutes a leading article of food in Italy, especially in Naples and Genoa, and it is much used elsewhere. Imitations of it are made in other countries from ordinary flour, which is much less suitable.

Specifically, *macaronic* verse or poetry is a kind of burlesque verse in which words of another language are mingled with Latin words, or are made to figure with Latin terminations and in Latin constructions. The term was brought into vogue by the popular satirical works in this style of the Mantuan Teofilo Folengo (died 1544). It is probable that this use of the word has reference to the varied ingredients which enter into the preparation of a dish of macaroni.

A *macaronic* style seems very often to mark the decline of an old literature and language, in countries exposed to powerful foreign influences.

**machicolation** (mā-chik'ō-lā'shon), *n.* [*<* ML. *\*machicolatio*(*n*-), *<* *\*machicollare*, *machicollare*, *machicollare*; see *machicollare*.] 1. In *architect.*, an opening in the vault of a portal or passage, or in the floor of a projecting gallery, made for the purpose of hurling missiles, or pouring down molten lead, hot pitch, etc., upon an enemy essaying to enter or mine. In the gallery type machicolations are formed by setting out the parapet or breastwork, *B.*, supported on corbels, beyond the face of the wall, *G.*, spaces between the corbels are left open, and constitute the machicolations. (See *cut* on following page.) Machicolations of permanent construction in stone were not introduced until toward the end of the twelfth century; but in the hoarding of wood with which walls and towers were crowned in time of need from the earliest period of the middle ages, their use was constant.

2. The act of hurling missiles or of pouring burning liquids upon an enemy through apertures such as those described above.—3. By extension, a machicolated parapet or gallery, or a projection supported on corbels, in imita-

**II. intrans.** To lay plots or schemes.

With inward arms the *dire machine* (wooden horse) they load. *Dryden, Euclid, ii. 25.*

**2.** In *mech.*, in general, any instrument for the conversion of motion. Thus, a machine may be designed to change rapid motion into slow motion, as a crowbar; or it may be intended to convert a reciprocating rectilinear motion into a uniform circular motion, etc. The lever, the wedge, the wheel and axle, the pulley, the screw, and the inclined plane are termed the *simple machines*. In practical mechanics the word has a restricted meaning: a single device, as a hammer, chisel, crowbar, or saw, or a very simple combination of moving parts, as fongs, shears, pincers, etc., for manual use, although comprised in the strict technical definition of *machine*, is always called a *tool* (which see); a device for applying or converting natural molar motion, like that of falling water, or of winds (as a water-wheel or windmill), or for converting molecular motion into molar motion (as a steam-engine, gas-engine, air-engine, or electric engine), is more generally,

though not uniformly, called a *motor*. The distinction between the words *tool* and *machine* becomes quite indefinite with increased complication of parts. Such machines as are used in shaping materials in the construction of the parts of other machines, and many of those which perform work, such as sawing, boring, planing, riveting, etc., formerly done only by hand and still performed manually to a greater or less extent, are variously called *machines*, *machine-tools*, *engine-tools*, or simply *tools*, although their structure may involve much complexity; the terms *machine-tool* and *engine-tool* are more frequently employed, the latter being preferable as being more in accord with best usage. Machines receive general or special names from the work they perform or are designed to execute, either with reference to departments of the arts or of industry, as *agricultural machines*, *hydraulic machines*, *wood-working machines*, etc., or to their specific work, as *planting-machines*, *sawing-machines*, *mowing-machines*, etc.

This science will define a *machine* to be, not, as usual, an instrument by means of which we may change the direction and intensity of a given force, but an instrument by means of which we may change the direction and velocity of a given motion. *Ampère, tr. by Willis.*

**3.** A vehicle or conveyance, such as a coach, cab, gig, tricycle, bicycle, etc. [*Great Britain.*]

A pair of bootkins will set out to-morrow morning in the *machine* that goes from the Queen's Head in the Gray's Inn Lane. *Walpole, Letters, IV. 12. (Davies.)*

**4.** A fire-engine. [*Colloq., U. S.*]—**5.** In the ancient theater, one of a number of contrivances in use for indicating a change of scene, as a rotating prism with different conventional scenery painted on its three sides, or a device for expressing a descent to the infernal regions, as the "Charonian steps," for representing the passage of a god through the air across the stage (whence the dictum *deus ex machina*, applied to the mock supernatural or providential), etc. Such machines were very numerous in the fully developed Greek theater, and were copied in the Roman.

**6.** A literary contrivance for the working out of a plot; a supernatural agency, or artificial action, introduced into a poem or tale; machinery. [*Archaic.*]

agers, through the distribution of offices, careful local supervision, and systematic correspondence, to maintain control of conventions and elections, and to secure a predominating influence in the party for themselves and their associates for their own ends; also, the body of managers of such an organization. [*U. S.*]—**Atwood's machine**, an apparatus for illustrating uniformly accelerated motion, consisting of a pulley-wheel turning with very slight friction in a vertical plane and carrying a cord with equal weights suspended from its ends. In the common experiment there is an excess of weight at one end of the cord, due to a plate which rests on the weight and is caught when the latter passes through a fixed ring; the weight is set free from a state of rest at a measured position above this ring, so that the acceleration takes place through a known distance; and the velocity per second after the removal of the excess of weight is observed to be proportional to the square root of the distance through which the acceleration takes place. The machine is named from its inventor, George Atwood (1746–1807), an English mathematician.—**Bulldog machine**, a combined sounding- and dredging-machine invented during the voyage of H. M. S. Bulldog in 1860, under the command of Sir Francis Leopold McClintock. It is an adaptation of Sir John Ross's deep-sea clam, with the addition of Brooke's principle of the disengaging weight. The chief credit of the invention is given to Mr. Steil, assistant engineer on board the Bulldog.—**Centrifugal machine.** See

*centrifugal*.—**Duck machine**, in Cornwall, a kind of ventilating-machine on the same principle as the ordinary blowing-engine, furnished with a piston and valves, and usually worked by the pump-rod. Also called *Hartz blower*.

The earliest instrument of this kind was the demonstrator of Charles, third Earl Stanhope: the most perfect is that of Professor Allan Marquand, which gives all inferences turning upon the logical relations of classes. The value of logical machines seems to lie in their showing how far reasoning is a mechanical process, and how far it calls for acts of observation. Calculating-machines are specialized logical machines.—**Reduced inertia of a machine**, according to Rankine, the weight which, concentrated at the driving-point, would have the same energy as the machine itself.—**To run with the machine**, to accompany a fire-engine to a fire, either as a member of the fire-company or as a hanger-on: a phrase used when the members of fire-companies (in large cities) were volunteers, and service at fires was gratuitous. [*V. S.*]

**machineel** (mach-i-nēl'), *n.* Same as *manchineel*.

**machine-gun** (ma-shēn'gun), *n.* A gun which, by means of a variously contrived mechanism, delivers a continuous fire of projectiles. Such a gun may have a single barrel, or a series of barrels arranged horizontally or about a central axis. Machine-guns may be divided into two classes: those firing small-arm ammunition (also called *mitrailleuses*), and those firing shot and shell (called *revolving cannon*). The rapidity of fire of the most rapid machine-guns of the first class is about 1,000 shots a minute. (See *Gatling gun, under gun*.)

Maxim Field-gun, with bullet-proof shield.

The *Maxim gun* is a single-barreled machine-gun invented by Hiram Maxim, an American. In it the force of recoil is utilized to load and prepare the next charge for firing, and a water-chamber surrounding the machinery keeps the parts cool. It is a very ingenious and efficient invention. The *Lowell battery-gun* has four barrels capable of being rotated by a lever, independently of the lock- and breech-mechanism. The firing is confined to one barrel at a time, until this becomes heated or disabled, when it may be rotated to one side in order to bring another barrel into action. One lock only is used. The *Taylor machine-gun*

Two-barreled Gardner Gun on Tripod.

has five parallel barrels arranged horizontally. The *Gardner machine-gun* has two to five barrels arranged horizontally. Its mechanism is simple, strong, and effective, but it can fire only about 350 shots a minute. The *Farwell machine-gun* consists of a group of ten steel barrels of 0.4 inch bore, each barrel having its own magazine, containing 50 cartridges. The operations of firing, extracting the empty shells, and reloading are accomplished by a single revolution of a crank. The *Hutchins revolving cannon* is the type of the second class of machine-guns. It combines the advantages of long-range shell-firing with rapidity of action. It has five barrels arranged around a central axis; and the breech is fixed and contains the loading, firing, and extracting mechanism. The rotation is intermittent, and the loading, firing, and extraction of the empty shell are performed while the barrels are at rest. This gun fires from 30 to 80 rounds of explosive shells in a minute, thus delivering from 750 to 2,000 fragments of shell with sufficient force to destroy life. There are many forms of this gun, each designed for a special object. One form, designed for flank defense of the ditches of fortifications, has every barrel rifled with a different twist, so arranged as to produce five different cones of dispersion, thus sweeping the ditch from end to end. The *Nordenflett machine-gun* was designed as a defense against torpedo boats. It is made with 2, 3, 4, 5, 7, 10, or 12 barrels, and it can fire either volleys or single barrels. In case a barrel becomes clogged or disabled, the supply of cartridges can be cut off from it and the firing continued with the other barrels.

The common mackerel, *S. scombrus*, is one of the best-known and most important of food-fishes, inhabiting the

Mackerel (*Scombus scombrus*).

North Atlantic on both sides. It attains a length of 18 inches, though usually less; it is lustrous dark-blue above, with many wavy blackish cross streaks, and is silvery below, with the base of the pectorals dark. The Easter, tinker, or chub mackerel is a closely related species, *S. punctatophorus*, so called from possessing a small air-bladder which is lacking in *S. scombrus*; it is found in both the Atlantic and Pacific oceans. The big eyed, bull, or coly mackerel is *S. colius*, a variety of the last, locally named *Spanish mackerel* in England. The Spanish mackerel of the United States is a scion of a different genus, *Scombrus maculatus*, of both coasts of North America, north to Cape Cod and California. It is one of the most valued food-fishes, reaching a considerable size, bluish and silvery above, with bright reflections, the sides with many rounded bronzed spots, the spinous dorsal fin white at base, dark above and anteriorly. Other mackerel of this genus are the cero, *S. regalis*, and the sierra, *S. cuballa*. Frigate-mackerels are scionids of the genus *Aurix*, as *A. thazard* or *A. rochei*, of less value as food-fish. The horse-mackerel properly so called is the tunny, *Thunnus thunnus*, the largest of the scombrids, sometimes attaining a length of over 10 feet and a weight of half a ton, found on both sides of the Atlantic; but this name is extended to various other fishes. (See *horse-mackerel*.) Several carangoid fishes are loosely called *mackerel*, as the yellow mackerel, *Caranx crysos*. (See *mackerel-said*.) The bluefish or skipper, *Pomatomus saltatrix*, is sometimes called *snapping mackerel*.

*Mackerel*, on account of its perishable nature, was allowed to be sold on Sunday, as Gay notes: "E'en Sunday's are proph'nd by *Mackerel* cries."

(a) See *def. 1*. (b) The bonito, *Sarda chilensis*, [California].—**Spotted mackerel**, the Spanish mackerel.—**Spring mackerel**, the ordinary commercial mackerel of good size and quality, sometimes technically named *Scomber verulius*; distinguished from *fall mackerel*. **Thimble-eyed mackerel**, the mixed, coly, or chub-mackerel. [Local, U. S.]—**Tinker mackerel**. (a) The chub-mackerel. (b) The common mackerel of next to the smallest of the four commercial sizes (*large*, *scouts*, *tinkers*, *blinks*), which are supposed to indicate respectively four, three, two, and one years of growth. par. < E. *madder*. Cf. Skt. *madhurā*, the name of several plants, < *madhura*, sweet, tender, < *madhu*, sweet; see *mad*.] 1. A plant of the genus *Rubia*, natural order *Rubiaceae*, yielding a valuable dyestuff of the same name. The ordinary dyer's madder is *R. tinctorum*, native of the Mediterranean region, a climbing, herbaceous, or at the base somewhat shrubby plant, with whorls of dark green leaves and panicles of small yellowish 4-5-merous flowers, and with long succulent perennial roots. It was formerly esteemed as an emmenagogue and diuretic. *R. cordifolia*, of India, eastern Asia, and parts of Africa, attords garcin, and is used for the same purposes as European madder; it forms the madder of India, the Bengal madder or munjeet. *R. peregrina* is the proper wild madder of England, found throughout western and southern Europe.

2. A dyestuff and pigment obtained from the roots of *Rubia tinctorum* and other plants of the same family. It yields colors of the greatest permanence, and is employed in dyeing linen and cotton red. Two kinds are fixed upon cotton: one is called *madder-red*, and the other, which possesses a much higher degree of luster and fixity, is called *Adrianople red*, because it is largely exported from that city, or *Turkey red*, from the fact that for a long time it was mainly obtained from the Levant; it is also produced near Leghorn and Trieste. In the trade this madder bears the name of *alizeri* or *lizeri*. The roots are broken up by means of wooden stampers, which reduce the bark and splint-bark to powder, leaving the hard inner part unbroken; but the whole root is sometimes pulverized. The coloring principle of madder is termed *alizerin*. Madder contains also a red pigment, *purpurin* or *rubiacin*, which is extracted in the form of orange-colored prismatic crystals, and yields a good dye, either alone or in combination with alizarin. Through the peculiar chemical affinity of phosphate of lime for its coloring matter, madder is noted for its remarkable physiological effect of turning red the bones of animals to which it is fed, as well as the claws and beaks of birds.—**Brown madder**, a lake prepared from madder-root, having a rich brown color of great depth.—**Capucine madder**. See *capucine*.—**Flowers of madder**, the trade-name for a preparation made by steeping pulverized madder, causing the sugar it contains to ferment, then washing the residue, pressing out the water, drying, and pulverizing it again. These are also known as *rubric lakes*.—**Madder-red**. See def. 2.—**Madder style**, a method of calico-printing in which the parts of the cloth which are to receive a madder color are printed with a mordant, washed and rinsed in a solution of alum and size, and then drawn through a colored solution which becomes fixed where the mordant has been applied, after which the dye is washed out the unmordanted part of the cloth. Also called *chints style*, *garcin style*.—**Petty madder**, a plant of the genus *Crucianella*, of the Mediterranean region. Also called *crosswort*.—**Refined madder**. The allusion in the def. is to the "woman in the city, which was a sinner," mentioned in Luke vii. 37-50, and, as in the heading of that chapter, traditionally identified (esp. since the 5th century, and in the Western Church, contrary to the tradition of the Eastern Church) with Mary Magdalene as mentioned (in another connection) in the next chapter,

"Mary called Magdalene, out of whom went seven devils" (Luke viii. 2). This identification was doubtless assisted by a confusion of the three anointings, one by "a woman in the city" (Luke vii. 37, as above), one by "a woman," also unnamed, in Bethany (Mat. xvi. 7 and Mark xiv. 3), and the third by "Mary," the sister of Martha and Lazarus, also in Bethany (John xi. 2 and xii. 3). to Sir J. F. W. of brightness may be judged of by the effect of strong moonlight, which totally obliterates the lesser, but not quite the greater." Thus, the noun is orig. from the adj.; but in Eng. it precedes it.] I. *n.* 1. Any supposed supernatural art; especially, the pretended art of controlling the actions of spiritual or superhuman beings. Belief in such an art exists among all primitive races, and was prevalent in medieval Europe. The practice of magic has embraced, in a great variety of ways, the cure of disease, the forecasting of events, and the gratification of desires otherwise unattainable. It has been everywhere, with the rise and earlier progress of literature, formulated into more or less elaborate systems. All kinds of divination, judicial astrology, and to a large extent alchemy were outgrowths of it.

But thrugh his *magik* for a wyke or tweye,  
It seemed that alle the rokkes were aweye.  
*Chaucer*, Franklin's Tale, l. 567.

(b) Control of natural forces through the knowledge of their laws.

Was not Persian Magic a reduction or correspondence of the principles and architectures of nature to the rules and policy of governments? . . . And here I will make a request that I may revise and reinterate the misapplied and abused name of *Natural Magic*; which in the true sense is but Natural Wisdom or Natural Prudence; taken according to the ancient acception, purged from vanity and superstition. *Bacon*, Advancement of Learning.

**Superstitions or goetic magic** consists in the invocation of devils or demons, and supposes some tacit or express covenant or agreement with them. —**White magic**, practice of magic either quite innocent or at least not involving a compact with the devil.

**Magic circle**, a modification of the magic square as devised by Franklin, consisting of eight concentric circles equally divided by eight radii, in the sections of which all the numbers from 13 to 75 are so arranged that the sum of the numbers in each circle, together with 12 entered at the center, is equal to 360, and that the sum of the numbers in each radial column, together with the central 12, is also equal to 360. As reconstructed by Dr. Barnard, the numbers from 1 to 64 are taken, and are so arranged that the constant sum of both concentric and radial ranks, added to 100 entered at the center, is 360. — **Magic cube**, an extension of the arrangement of an arithmetical series in a magic square or parallelepipedon to all sides of a hexagon, so that the sum of the numbers in each lineal rank of numbers, parallel to the edges of the cube or the diagonals upon all faces, is constant. In a perfect magic cube every term enters into thirteen distinct equalities. — **Magic cylinder**, a modification of a perfect magic cube or parallelepipedon when one of its surfaces is transferred to a cylinder having a circumference equal to the edge of the cube, and the vertical squares are arranged in equidistant radii: such a magic cylinder will have either no number at the axis, or the same number in the center of every one of the five parallel planes. — **Magic lantern**. See *lantern*, and cut under *stereopticon*. — **Magic music**. See *music*. — **Magic sphere**, a modification of a magic cube or parallelepipedon when its surface is transferred to a sphere, and the several vertical columns are arranged in equidistant radii. — **Magic square**, a square figure

formed by a series of numbers in mathematical proportion, so disposed in parallel and equal ranks that the sum of each row or line taken perpendicularly, horizontally, or diagonally is constant. Magic squares are also formed

**magisteria**, *n.* Plural of *magisterium*.

**magisterial** (maj-is-tē'ri-əl), *a.* [*< L. magisterium, the office of a chief, president, master, director, teacher, etc. (see magistry), + -al.*]

1. Of or pertaining to a master; such as befits a master: authoritative; hence, lofty; arrogant; imperious; domineering.

Those who have fairly and truly examin'd, and are thereby got past doubt in all the doctrines they profess and govern themselves by, . . . are so few in number, and find so little reason to be *magisterial* in their opinions, that nothing insolent and imperious is to be expected from them.

See *district*, 1. = **Syn.** 1. *Authoritative, Magisterial, Dogmatic, Arrogant, Domineering, Imperious, Dictatorial, Peremptory*, official, grand, haughty, lordly, oracular. *Authoritative* is rarely used in a bad sense. *Magisterial*, in the sense of having the manner of a master or magistrate, generally indicates the overdoing of that manner: as, *magisterial pomp* and gravity. *Dogmatic* reaches somewhat more deeply into the character; the *dogmatic* man insists strenuously upon the correctness of his own opinions, and, being unable to see how others can fail to believe with him, *dictatorially* presses upon them his opinions as true without argument, while he tends also to blame and overbear those who venture to express dissent. (See *confident*.) *Arrogant* implies the assumption of more than due authority from an overestimate of one's importance. (See *arrogance*.) *Domineering, imperious, and dictatorial* apply to the assertion of one's own will over those of others in the attempt to rule. *Domineering* suggests unfriendliness or lack of authority to rule, with an insulting, hectoring, or bullying manner. *Imperious* contains most of the real power of the will, suggesting a lofty or lordly determination to be obeyed. *Dictatorial* implies, on the one hand, a disposition to rule, and, on the other, a sharp insistence upon having one's orders accepted or carried out. *Peremptory* shuts off discussion; a *peremptory* command or denial is one that must be obeyed or accepted to the letter and without debate; it is positive, absolute, and often immediate.

**magisteriality** (maj-is-tē'ri-āl'i-ti), *n.* [*< magisterial + -ity.*] *Magisterial* character or administration: domination.

When these statutes were first in the state or *magisteriality* thereof, they were severely put in practice.

He that hath had Water turned to Ashes hath the *Magistry*, and the true Philosopher's Stone.

*Howell*, Letters, I. vi. 41.

Although *magistry* be a term variously enough employed by chemists, and particularly used by Paracelsus to signify very different things, yet the best notion I know of it . . . is, that it is a preparation whereby there is not an analysis made of the body assigned, nor an extraction of this or that principle, but the whole or very near the whole body, by the help of some addition, greater or less, is turned into a body of another kind.

*Boyle*, Works, I. 637.

*Magisteries* seem to have been thus called by the ancient chemists as denoting the capital production or masterpiece of their art. They pretend that they are able to take any simple body, and without any change of its weight, or division of its parts, alter it into another exceedingly different from the former, and usually liquid; for instance, to reduce an ounce of gold into a fluid of the same weight, by fire alone, without the addition of any other matter.

The term *magma* is also frequently used to designate molten or plastic material lying beneath the surface, which it is desirable to speak of without any specific indication of its mineral character, in discussing the phenomena of volcanism, metamorphism, etc.

Carrying out this idea still further, he [Durocher] propounded the theory that beneath the earth's solid crust there exist two *magmas*, the upper consisting of light acid materials, the lower of heavy basic ones; and he supposes that by the varying intensity of the volcanic forces we may have sometimes one or the other *magma* erupted and sometimes varying mixtures of the two.

**magnesium** (mag-nē'si-ūm), *n.* [NL.; in def. 1, < Gr. *Μαγνησις*, *sepiolite*, *magnet*; in def. 2, < *magnesia*, 2.] 1. Manganese. — 2. Chemical symbol, Mg; atomic weight, 24.4. The metallic base of the widely distributed alkaline earth magnesia, which in various combinations, and especially in the form of the double carbonate of lime and magnesia, is one of the most abundant of the materials which make up the earth's crust. It is a metal of a brilliant silver-white color, having a specific gravity of 1.75. It melts at a red heat, and boils at a temperature somewhat above that at which zinc volatilizes. When held in the flame of a candle it burns with a dazzlingly white light, which has been seen at sea at a distance of 25 miles. Magnesium was first prepared in a pure state by Bussy; that which had been previously obtained by Davy was impure and not a coherent metal. It is now manufactured on a large scale at various places, especially near Manchester in England, and is pressed when in a semi-fluid state into wire, and then flattened into ribbon, in which form it is generally sold. It is used in taking photographs in places into which the sunlight does not penetrate, in signaling for naval and military purposes, and in pyrotechny, as well as in some operations connected with chemical analysis. The magnesian combinations are widely distributed in nature. From 5 to 6 per cent. of the solid material held in solution by the water of the ocean is magnesium sulphate, and from 8 to 11 per cent. magnesium chloride. Next to sodium, chlorine, and sulphuric acid, magnesium is the most abundant ingredient in solution in the ocean. It is, with rare exceptions (as in the case of the genus *Serpula*), not taken from the ocean by animal life, differing greatly in this respect from lime. Magnesium carbonate, in combination with calcium carbonate, forming dolomite, occurs in enormous quantity among the stratified formations. Beds made up of almost chemically pure dolomite hundreds of feet thick cover thousands of square miles in the valley of the upper Mississippi. Magnesium carbonate also occurs in great abundance, mixed in varying proportions with the calcium carbonate, in much of the rock designated as *marble* and *limestone*, which, when this fact becomes known by chemical analysis, are denominated *dolomitic*. Magnesia also plays the part of base in great numbers of silicates, especially in talc, *meerschaum*, *serpentine*, *olivine*, and the pyroxenes and hornblendes. Magnesian silicates form

an important part of numerous meteorites. The pure magnesium carbonate (magnetite) occurs in various localities, but is by no means an abundant mineral. The non-silicified soluble compounds of magnesia are also of rather rare occurrence in nature, but are found in considerable quantity in a few localities, among which that in the vicinity of Stassfurt in Prussia is economically of by far the greatest importance. The combinations found there are kaimite, carnallite, and kieserite. (See these words.) Both magnesium sulphate and magnesium chloride occur in the water of many mineral springs as well as in that of the ocean. The bones of animals and the seeds of various cereals contain a small amount of magnesium phosphate, and the salt is also found in guano. Magnesian salts are used to a limited extent in medicine, especially the sulphate (Epsom salts); they are also used in dressing cotton goods and in dyeing; but, on the whole, the economical importance of the combinations of magnesium, considering their abundance and the cheapness with which they could be furnished in large quantity, is exceedingly small.

**magnesium-lamp** (mag-nē'si-ūm-lamp), *n.* A lamp in which magnesium is burned for the purpose of illumination. Such lamps are of various types, being adapted for the combustion of the metal in the form of a wire or ribbon or in a pulverized state.

**magnet** (mag-net), *n.* [ME. *magne* = D. *magne* = MHG. *magues*, *maguete*, G. *magnet* = Dan. Sw. *magnet* = OF. *maguete*, *maguete* (the mod. F. term is *aimant*; see *adamant*, *aymant*) = Sp. Pg. It. *magnete*, < L. *magnes* (*maguet*) (with or without *lapis*, stone), a magnet, < Gr. *μαγνης*, also *μαγνησα*, prop. adj., *Μαγνης*, *Μαγνησις*, *Μαγνησία*, *Μαγνησσα* (see *λίθος*), a magnet, lit. stone of Magnesia. < *Μαγνης* (*Μαγνησις*), also *Μαγνητις*, an inhabitant of Magnesia, < *Μαγνησία*, Magnesia, a district in Thessaly, where the magnet or magnetic iron ore appar. first came to notice.] A body which possesses the property of attracting fragments of iron or steel, and which, when freely suspended, tends, under the action of the earth, to take a certain definite position, pointing approximately north and south. The lodestone, a variety of the mineral magnetite, or the native magnetic oxide of iron (Fe<sub>3</sub>O<sub>4</sub>), is a natural magnet; but the properties of the magnet are best shown by an artificial magnet (see below), which has commonly the form of a straight bar or that of a horseshoe. When a bar-magnet is dipped into iron filings, it is found that they adhere most strongly at the extremities of the bar (which are called the *poles* of the magnet), and not at all along the line midway between them. Strictly speaking, however, except in the case of a long thin magnet, the poles are not exactly at the ends. The middle line is called the *neutral line* or *equator* of the magnet; the straight line joining the poles is the *axis* of the magnet, or *magnetic axis*. A magnetic bar may abnormally have one or more intermediate points of maximum attraction, which are then

Steel Magnet with consequent poles at *a* and *b*.

called *consequent poles*. Again, if a magnetic needle is suspended at its center of gravity so as to be entirely free to turn, it is found that in general it places itself with its axis in a direction nearly north and south, and with one end inclining downward. The pole which is directed toward the north is called the *north* or *north-seeking pole*, also the *boreal*, *positive*, or *red pole*, or *marked end* of the needle; the other, the *south*, *south-seeking*, *austral*, *negative*, or *blue pole*, or *unmarked end*. It is found, further, that the like poles of two magnets repel and unlike poles attract each other. If a magnet is broken into halves, each half is found to be a complete magnet with a north and a south pole; and this is true no matter how often the process of division is repeated. On this and other more fundamental grounds, it is concluded that the magnetic polarity belongs to each molecule throughout the bar, and the maximum attraction observed near the ends is only the resultant effect of all these individual forces. (See *magnetism*.) A *magnetic substance* is one which may be attracted by a magnet, but has not the property of attracting other magnetic substances, and therefore has no polarity. Soft iron is a magnetic substance, as is also most magnetite, the lodestone variety being exceptional. A *permanent magnet* is one which retains its magnetism after the magnetizing influences (see below) cease to act. Steel and the lodestone have this property, on account of their high degree of coercive force. (See *coercive*.) Soft iron has a very little coercive force, and accordingly its power of retaining magnetism is small. An *artificial magnet* (as a compass-needle) is made by contact with other magnets, and the methods employed are described as *single-touch*, *double-touch*, and *separate-touch*, according to the way in which the substance to be magnetized is rubbed by the magnets. Such a magnet may also be made by magnetic induction without actual contact. (See *induction*, 6.) Again, a magnet may be made by passing a current of electricity through a wire wound about the bar to be magnetized; this is called an *electromagnet* (which see). By this means magnets of very great strength may be made. They have usually a horseshoe form, and the bar is of soft iron, so that it retains its magnetism only so long as the current is passing. The earth may be considered as a huge magnet, whose poles

are situated in the neighborhood of the geographical poles, though not coinciding with them; the north magnetic pole of the earth corresponds in polarity to the south-seeking pole of a magnetic needle. The action of the earth causes a freely suspended needle to set in a plane called the *magnetic meridian*, which in general makes an angle east or west of the geographical meridian (see *declination*), and with one pole (in the northern hemisphere, the north-seeking pole) inclined downward (see *dip of the needle*, under *dip*). The earth's magnetic force also serves to induce magnetism in masses of iron lying in or near the magnetic meridian. An iron ship is thus magnetized in the course of its construction. Similarly, iron columns, etc., are often found to be feebly magnetic. Magnetic properties belong also to some other compounds of iron besides the magnetic oxide, as pyrrhotite or magnetic pyrites (Fe<sub>7</sub>S<sub>8</sub>), and to some varieties of the native sesquioxide, hematite (Fe<sub>2</sub>O<sub>3</sub>); also to the magnetic metals nickel, cobalt, chromium, and manganese. Some varieties of platinum are strongly magnetic, and occasionally masses have polarity also, but this may be due to the large percentage of iron present, although all so-called large platinum does not show this property. Finally, it is found that a powerful electromagnet exerts an effect on all substances, in accordance with which they are divided into the two groups *paramagnetic* and *diamagnetic* (this is explained under *diamagnetism*). — **Compound magnet**. Same as *magnetic battery*. — **Deflecting-magnet**, a magnet used for deflecting a magnetic needle: often attached to a galvanometer for the purpose of fixing the zero of the needle in a certain position, or for altering the sensitiveness of the needle by changing the magnetic field. Also called *zero magnet*, *directing-magnet*, and *deflector*. — **Horseshoe magnet**, a magnet having a form somewhat resembling a horseshoe (see figure), being bent so that the two poles are brought near together, and hence can act at the same time upon the keeper or armature. A horseshoe electromagnet commonly consists of two hollow sides by side, whose cores are connected at one end by a piece of soft iron. — **Moment of a magnet**. See *moment*. — **Permanent magnet**. See the definition. — **Portative force of a magnet**, the maximum weight which a magnet can support. — **Receiving-magnet**. Same as *relay-magnet*. — **Relay-magnet**, or *relay*, in telegraph, a sensitive electromagnetic receiving instrument used to close a circuit in the receiving station, which contains a battery and a less sensitive receiving instrument, such as a sounder or a register; also used to retransmit a message over another section of the line. See *transmit*. — **Saturated magnet**. See *magnetism*. — **Solenoidal magnet**, a long and thin bar-magnet, uniformly magnetized, whose poles are at or very near the ends. In such a magnet the distribution of the magnetism is said to be solenoidal, in distinction from the lamellar distribution of a magnetic shell (which see, under *magnetism*). — **To arm a magnet**. See *arm*. — **To make the magnet**. See *make*.

Knight*. — **Magnetic shell**, a magnet in the form of a very thin plate or sheet, the surfaces of which have opposite polarity. A thin slice of a cylindrical bar-magnet would be a magnetic shell; or, in other words, a bar-magnet may be thought of as made up of a great number of magnetic shells placed together with their poles facing in the same direction. A closed electric circuit—for example, a circular wire traversed by a current—is equivalent to a magnetic shell; and a series of such circuits, or practically a solenoid, has all the properties of a bar-magnet, and is surrounded by a similar field of force. — **Magnetic storm**, an abrupt disturbance of the equilibrium of the magnetic forces controlling a freely suspended magnetic needle, which is thereby thrown into rapid oscillation and displaced from its mean position: usually observed simultaneously over a considerable portion of the earth, and hence inferred by some to be of cosmid origin. That peculiar property occasionally possessed by certain bodies (more especially by iron and steel) whereby, under certain circumstances, they naturally attract or repel one another according to determinate laws.

According to the molecular theory of magnetism, the molecules of a magnetic substance possess permanent polarity, and as it is more and more highly magnetized the poles are arranged more and more perfectly in a common direction; when it is magnetized to the highest degree possible—that is, to saturation—all the north poles of the molecules point in one direction and all the south poles in the opposite direction. On this theory coercive force is simply that condition of the substance which retards this molecular arrangement during the process of magnetization and tends to retain it after magnetization. The current theory, or Ampère's theory of magnetism, supposes each molecule to be traversed by a closed electric circuit; these currents become parallel upon magnetization, and may then be regarded as equivalent to a series of closed electric currents about the exterior of the bar, these currents being clockwise at the south pole and counter-clockwise at the north pole. This theory derives its support from the observed fact that a spiral conductor traversed by a current (a solenoid) behaves as a magnet in all respects, being directed similarly by the earth and having a similar field of force about it. See *magnet*.

In many treatises it is the fashion to speak of a magnetic fluid or fluids; it is, however, absolutely certain that *magnetism* is not a fluid. . . . A fluid cannot possibly propagate itself indefinitely without loss.

It occurs in isometric crystals, generally octahedrons or dodecahedrons, and also more commonly massive in beds in the older crystalline rocks; in the form of scattered grains or crystals it is a common constituent of many igneous rocks. **magnifier** (mag'ni-fi-ēr), *n.* 1. One who or that which magnifies or enlarges.

Mens hilaris, requies, moderata dicta is a great *magnifier* of honest mirth.

*Burton*, *Anat. of Mel.*, p. 208.

2. Specifically, an optical instrument that magnifies; a convex lens, a concave mirror, or a combination of lenses or mirrors, which increases the apparent magnitude of bodies.

**magnifiquet**, *a.* An obsolete form of *magnific*.

**magnify** (mag'ni-fi), *v. t.* pret. and pp. *magnified*, pp. *magnifying*. [*Gr. magnific*, < OF. (also F.) *magnifier* = Sp. *Pg. magnificar* = It. *magnificare*, < L. *magnificare*, make much of, esteem highly, praise highly, extol, magnify, < *mag-nus*, great, + *facere*, make. Cf. *magnific*.]

1. To make greater; increase the size, amount, or extent of; enlarge; augment. [Rare in this literal sense.]

The least error in a small quantity, as in a small circle, will, in a great one, as in the circles of the heavenly orbs, be proportionally *magnified*.

*X. Greve, Cosmologia Sacra, ii. 5.*

Speak, e'er my Fancy *magnify* my Fears.

*Congreve, To Cynthia.*

2. To cause to appear greater; increase the apparent dimensions of; enlarge or augment to the eye: as, a convex lens *magnifies* the bulk of a body to the eye.

Since the shorter the focus of the lens the more closely may the object be approximated to the eye, the retinal picture is enlarged, causing the object to appear *magnified* in the same proportion.

*Encyc. Brit., XIV, 259.*

3. To exalt the power, glory, or greatness of; sound the praises of; extol; glorify.

O, *magnify* the Lord with me, and let us exalt his name together.

**Magnifying power of a microscope**, the ratio of the length upon the retina of any part of the image of the object looked at with the microscope to the length of the retinal image of the same object looked at without the microscope at a standard distance of 10 inches.

In regard to the magnifying power of eye-glasses, complicated considerations have to be introduced.—**Magnifying power of a telescope**, the ratio in which the angle subtended by any linear dimensions of the object looked at is increased by the telescope. It is always equal to the focal length of the object-glass divided by that of the eyepiece. For a distant object the focal length of the object-glass is that for parallel rays—that is, its principal focal length; for nearer objects the focal length is greater, and the magnifying power is correspondingly increased.

**magnifying-glass** (mag'ni-fi-ing-glās), *n.* In optics, a convex lens: so called because objects seen through it have their apparent dimensions increased.

**magnifying-lens** (mag'ni-fi-ing-lenz), *n.* See *lens*.

**magniloquence** (mag-nil'ō-kwens), *n.* [*L. magniloquentia*, a lofty style or strain of language, < *\*magniloquen(t)-s*, *magniloquus*, speaking in a lofty style: see *magniloquent*.] The quality of being magniloquent; a lofty manner of speaking or writing; exaggerated eloquence; grandiloquence; bombast.

All the sects ridiculed this *magniloquence* of Epicurus, as inconsistent with his whole system.

*Bentley, Remarks, § 44.*

There was something surprising and impressive in my friend's gushing *magniloquence*.

*H. James, Jr., Pass. Pilgrim, p. 107.*

**magniloquent** (mag-nil'ō-kwent), *a.* [*L. \*magniloquen(t)-s*, equiv. to *magniloquus*, speaking in a lofty style, < *magnus*, great, lofty, + *loquen(t)-s*, pp. of *loqui*, speak: see *locution*.] Speaking or writing in a lofty style; grandiloquent; bombastic.

**magnitude** (mag'ni-tūd), *n.* [= *F. magnitude* = *Sp. magnitud* = *Pg. magnitude* = *It. magnitudine*, < *L. magnitudo*, greatness, bulk, size, rank, dignity, < *magnus*, great, large, grand, noble, important, etc.; compar. *major* (see *major*), superl. *maximus* (see *maximum*); with formative *-n*, < *\*mag*, akin to *Gr. megas* (*megas*), great, large, = *AS. micel*, great, much, *Skt. mah*, orig. *\*magh*, be great: see *mickle*, *much*. Cf. *main*.] 1. Greatness; vastness, whether in a physical or a moral sense; grandeur.

With plain heroic *magnitude* of mind.

*Milton, S. A., l. 1279.*

We commonly find in the ambitious man a superiority of parts, in some measure proportioned to the *magnitude* of his designs.

*Horsley, Works, l. iv.*

2. Largeness of relation or significance; importance; consequence: as, in affairs of *magnitude* disdain not to take counsel.—3. Size, or the property of having size; the extended quantity of a line, surface, or solid; length, area, or volume.

And fast by, hanging in a golden chain,  
This pendent world, in bigness as a star  
Of smallest *magnitude*.

*Milton, P. L., ii. 1053.*

One may learn how the feeling of *magnitude* varies with changes in the absolute *magnitude* of the object, and so reach a more precise and scientific statement of this particular aspect of the coexistence between body and mind.

*J. Sully, Sensation and Intuition, p. 44.*

4. Any kind of continuous quantity which is comparable with extended quantity. In this sense we speak of the magnitude of a velocity, force, acceleration, or other vector quantity; but we do not properly speak of a magnitude of heat, energy, temperature, sound, etc. The use of the word as a synonym of *quantity*, as in the following passage, is to be deprecated.

By intensive *magnitude* is meant the strength of a sensation; by extensive *magnitude*, its volume, which roughly speaking corresponds to the area of the sentient surface and the number of nervous elements acted upon.

*J. Sully, Sensation and Intuition, p. 44.*

5. In *astron.*, the brightness of a star expressed according to the numerical system used by astronomers for that purpose. In this sense *magnitude* translates Greek *μεγέθος*, used in the same sense in the *Almagest*, the expression being due to the fact that bright stars, by an effect of irradiation, look larger than faint ones. The brightest stars are said to be of the first magnitude, while those of the sixth magnitude are hardly noticed by casual observers in ordinary states of the sky. Since the brightness of stars has been measured photometrically, the interval between successive magnitudes has been defined by a constant ratio of brightness, which in the so-called absolute scale, now generally used, is  $\sqrt[5]{100}$ , or 2.51.

6. In *anc. pros.*, the length of a syllable, foot, colon, or meter, expressed in terms of the metrical unit (primary time, seneion, or mora): as, a foot of trisemic *magnitude*; a colon of icosaemic *magnitude*.—**Absolute magnitude**. See *absolute*.—**Angular magnitude**, the quantity of an angle.—**Apparent magnitude of an object**, that magnitude which is measured by the optic or visual angle intercepted between lines drawn from the extreme points of the object to the center of the pupil of the eye. This angle may be considered to be inversely as the distance of the object. [This phrase is used chiefly with reference to the heavenly bodies, but is employed also in many branches of optical science, with the same general meaning.]—**Center of magnitude**. See *center*.—**Syn. Bulk, Volume, etc.** See *size*.

**magnoferrite** (mag-nō-fer'it), *n.* See *magnesian-ferrite*.

**Magnolia** (mag-nō'li-ä), *n.* [NL. (Plumier, 1703), named after Pierre Magnol, a French botanist (1638-1715).] 1. A genus of plants, type of the natural order *Magnoliaceæ* and the tribe *Magnolieæ*, characterized by a sessile cone-shaped cluster of pistils, and two-ovuled persistent carpels which open down the back at maturity. They are trees or shrubs with entire alternate leaves, often evergreen, conduplicate in the bud, and then protected by membranous stipules, and large showy flowers which are solitary and terminal. The calyx consists of three deciduous sepals, and the corolla of six to twelve petals, usually white or purplish; and the stamens and pistils are numerous. The flowers are generally fragrant, and the fruit is a spike, consisting of a number of follicles, from the openings of which the scarlet or brown seeds are suspended at maturity by long and slender threads. There are about 15

species, indigenous to subtropical Asia and the eastern part of North America. They are almost all very ornamental and are frequently cultivated. *M. conspicua* is the yulan. *M. grandiflora* is the big laurel or bull-bay of the southern United States, a fine forest-tree, 60 or 80 feet high, evergreen, with fragrant flowers. *M. microphylla* is the great-leaved cucumber, a less common tree of the same region. *M. umbellata* is the umbrella-tree. *M. acuminata*, the cucumber-tree or mountain-magnolia, extends north to New York and Ohio. Another cucumber-tree is *M. cordata*, growing in the Southern States. *M. glauca*, a moderate-sized tree, or northward a shrub, grows in swamps from Massachusetts to Florida and Texas. It has globular fragrant flowers, 2 inches long, the leaves ever-

green in the south. It is variously named *spall* or *laurel magnolia*, *sweet-bay* or *white-bay*, *white laurel* or *swamp laurel*; also *beaver-tree* and *swamp magnolias*. The genus appears very early and very abundantly in the fossil state, over 50 species having been described. This pie is lustrous-black, with green, purple, violet, and golden iridescence; the under parts from breast to crissum, the scapulars, and a great part of the inner webs of the primaries are white; the bill and feet are black. The bird is from 15 to 20 inches long, according to the development of the tail, which is 12 inches or less in length, extremely graduated; the stretch of wings is about 2 feet. Magpies are omnivorous, like most corvine and garruline birds, and noted for their craftiness, kleptomania, and mimicry. They nest in trees and shrubs, building a very

2. In Christian history, one of the "wise men" who, according to the Gospel of Matthew (ii. 1, 2), came from the East to Jerusalem to do homage to the new-born King of the Jews. A tradition as old as the second century (resting on Ps. lxxix. 10; Isa. xlix. 7) makes them kings, and at a later period the names Melchior, Kaspar, and Balthasar become attached to them. As the first of the pagans to whom the birth of the Messiah was announced, they are honored at the feast of Epiphany: in the calendar, however, the three days immediately following the first of the new year are called after them. In works of art the youngest of them is represented as a Moor.

It contains a history of the contest for supremacy between the two great royal families of northern India, the Pandavas and the Kurus or

Kauravas, ending in the victory of the former and the establishment of their rule. In reality, this narrative occupies but a fourth of the poem, the other three fourths being episodic and added at various times. The *Mahabharata* thus became a sort of encyclopedia, embracing everything that it concerned a cultivated Hindu to know.

**Mahadeva** (ma-hä-dä'vä), *n.* [*Skt. mahadeva*, < *mahä*, great, + *deva*, god: see *deity*.] A name of Siva, the third deity of the great Hindu triad.

No beings so named and endowed have any ancient recognition in Indian literature.

**Mahdi** (mä'dē), *n.* [Also sometimes *Mchdee* (< *Turk. mehdi*); < *Ar. mahdi*, a guide, leader, esp. a spiritual director, lit. 'the guided or directed one,' < *ma-*, a formative prefix, + *chdi*, guide (< *hēdi*, a guide in religion, spiritual director, *hidaya*, guidance).] According to Mohammedan belief, a spiritual and temporal ruler destined to appear on earth during the last days. Some sects hold that the Mahdi has appeared, and in concealment awaits the time of his manifestation. There have been a number of pretended Mahdis, of whom the latest of importance was the chief whose armed followers resisted the advance of the British troops into the Sudan in 1884-85, and overthrew the Egyptian power in that region, which they continued to hold. The belief apparently grew out of the Jewish belief in the coming of the Messiah.

It is from the descendants of 'Alee that the more devout Moslems expect the *Mehdee*, who is to reappear on earth in company with the Prophet Elias, on the second coming of Christ. *J. P. Brown*, *The Dervishes*, p. 74.

*Mahdi*, or 'the well-guided,' is the name given by the Shi'ites to that member of the family of 'Ali who, according to their belief, is one day to gain possession of the whole world, and set up the reign of righteousness in it. *Encyc. Brit.*, xvi. 570.

**Mahdian** (mä'di-an), *n.* [*< Mahdi* + *-an*.] One who holds that the Mahdi whose coming was foretold by Mohammed has already appeared; specifically, one who holds that the Mahdi has already appeared in the person of Mohammed Abu el-Qasim, the twelfth Imam, who is supposed to be concealed in some secret place awaiting the hour of his manifestation. The Shi'ahs in general hold this view. Also *Mahdist*.

**Mahdiism** (mä'di-izm), *n.* [*< Mahdi* + *-ism*.] The doctrine of, or belief in, the coming of the Mahdi. *Fortnightly Rev.*, xliiii. 701.

**Mahdism** (mä'dizm), *n.* [*< Mahdi* + *-ism*.] Same as *Mahdiism*. *The Academy*, Oct. 20, 1888, p. 249.

A cereal plant, *Zea Mays*, of the grass family; the Indian corn. In America commonly called simply *corn*; in Europe formerly *Turkey corn* or *Turkey wheat*. For description, see *Zea*.

2. The grain produced by the maize; Indian corn. It appears in market either in the ear (i. e., on the cob) or shelled (i. e., removed from the cob). It is a highly nutritious food, starchy matter predominating in it. As human food it is used in various forms. (See *corn-bread*, *hasty-pudding*, *Indian meal*, *hominy*, *corn-starch*, *samp*.) The immature kernels (green corn), boiled, form an excellent vegetable, and in this state maize is largely preserved by canning. Of late years Indian corn has been extensively manufactured into glucose. Maize is said to furnish food to a larger part of the human race than any other grain except rice. It is also much used for fattening cattle and swine, as well as for horses. An enormous amount is consumed in the manufacture of spirits; it is the principal grain distilled in the United States. Maize was found in cultivation over a great part of America on its discovery, and was rapidly diffused throughout the world wherever the climate was suitable to it.

**majolica** (ma-jol'i-kā; It. pron. mā-yō'li-kā), *n.* [*< Maiolica, for Majoreca* (Sp. *Malorca*), whence the first specimens came.] 1. Decorative enameled pottery, especially

that of Italy from the fifteenth to the seventeenth century. The name is applied particularly to the more richly adorned pieces, the colors of which have remarkable intensity. (See *mezza-majolica*.) Modern writers on ceramics have attempted to limit it to lustered pottery, especially that of the middle ages and the sixteenth century, made in Majoreca or in Spain, or more especially in Italy, in supposed imitation of ware from the two former countries.

2. As applied to modern pottery, a kind of ware which in effects of color partly imitates the pottery above defined, especially in large pieces used for architectural decoration, garden-seats, vases, etc. This ware is usually much harder and more perfectly manufactured than the ancient, but is inferior in decorative effect, being cast in molds and having a mechanical look. **Fontana majolica**, a variety of the majolica of Urbino, the name *Fontana* having been adopted by certain of the leading decorators of that school. The painter known as *trazio Fontana* is the most celebrated of these; his work takes rank among the finest productions of the sixteenth century.

Greater; more important or effective; first in force or consideration; leading; principal; as, the *major* premise or term of a syllogism.*

*Lanier, Science of Eng. Verse, p. 241.*

3†. Of age: having attained to majority. *Godwin*.—4. In *music*: (a) Of intervals, standard or normal: literally "greater," as compared with minor intervals. The term is more often applied to seconds, thirds, sixths, sevenths, and ninths, des-

ignating an interval equivalent to the interval between the key-note of a standard or normal scale and its second, third, sixth, seventh, and ninth tone respectively. Thus, a *major second* is two semitones long, a *major third* four semitones, a *major sixth* nine semitones, and a *major seventh* eleven semitones. *Major* has also been applied of late to fourths, fifths, and octaves, and is then equivalent to the older term *perfect*. Finally, it is used to distinguish the larger of two intervals that differ by a minute quantity: as, a *major step* or tone (°), which is a comma greater than a minor tone. Opposed to *minor*, and also often to *diminished* and *augmented*. See *interval*, 5. (b) Of tones, distant by a major interval from a given tone: as, A is the *major third* of F, etc. (c) Of tonalities and scales, standard or normal: characterized by a major third and also by a major sixth and seventh: opposed to *minor*. The *major tonality* or *scale* is the recognized standard of reference for all the modern musical systems. See *key*, *tonality*, and *scale*. (d) Of triads and chords, characterized by a major third between the root and the tone next above, and a perfect fifth between the root and the second tone above: opposed to *minor*, *diminished*, and *augmented*. The *major triad* is the usual standard of reference in classifying the chords of modern music. See *triad* and *chord*. (e) Of cadences, ending in a major triad. (f) Of modes in the modern sense, and thus of composition in general, characterized by the use of a major tonality and of major cadences: as, a piece is written throughout in the *major* mode. From an acoustical point of view, major intervals, chords, and scales are simpler and stronger in themselves and admit of better harmonic extension and combination than minor. The educated taste of modern times has tended to exalt the major over the minor, making the former the standard and normal of which the latter is the variation; while the medieval systems, being based upon a different conception of music at various points, tended the other way. The esthetic effect of the major in contrast with the minor is brighter, stronger, and more complete. It has recently been maintained that major and minor phenomena, in all their phases, are mutually reciprocal, the major triad, scale, etc., being measured upward in a certain way from a given tone, and the minor triad, scale, etc., being measured downward in the same way from the same tone. According to this view, the major triad of C is called the *over-chord* of C, and the minor triad of F is called the *under-chord* of C, etc.

5. In *logic*, wider; broader; more extensive; a predicate to more subjects. The *major extreme* or *major term* of a syllogism is that term which enters into the predicate of the conclusion; the *major premise* is that premise which contains the major term. These have always been the usual definitions, but they have been subject to much dispute, owing to the fact that all real distinction between major and minor vanishes in certain cases.—**Bob major**. See *bob*, 7.—**Major axis**. Same as *transverse axis* (which see, under *axis*).—**Major function**. See *function*.

Air contaminated with some pathogenic substance from the soil; specifically, air impregnated with the poison producing intermittent and remittent fever.—2. The disease produced by the air thus poisoned. In a strict sense the word is a generic term designating intermittent and remittent fever and other affections, such as malarial neuralgia, due to the same cause. Malarial diseases in this sense prevail in all quarters of the globe except the coldest, and the infection of soil and air occurs in both uninhabited and populous regions. The disease is contracted by presence in the locality, and not from the sick, nor do the latter seem to transplant the infection to new places to which they may go. The disease may apparently be introduced into the body through water that is drunk as well as through the air. The development of the poison is favored by heat and moisture. Malarial diseases are apt to increase after the turning up of virgin soil. The poison seems to lie low in the atmosphere, but may be blown to adjacent heights. Besides the well marked

fevers, the malarial poison produces various and often ill-marked perversions of the general health, such as neuralgia, neuritis, anemia, digestive disturbances, and albuminuria. The anatomical effects of the malarial poison are enlargement of the spleen, sometimes excessive, darkening of the skin, and the presence of a dark pigment in the blood, in amorphous masses. There is found, moreover, in malarial blood a variety of peculiar living bodies which are supposed to be the various stages in the life-history of a single organism. This has been called the *Plasmodium malarie*. All these forms of malaria are, as a rule, affected favorably by quinine, and to a less degree by certain other drugs, notably arsenic.

**malleolus** (ma-lē-ō-lus), *n.*; pl. *malleoli* (-lī). [NL., *<* L. *malleolus*, a small hammer, dim. of *malleus*, a hammer; see *malleus*.] 1. In *anat.*, a bony protuberance on either side of the ankle. The two together contribute to the stability of the ankle joint, by locking the astragalus so as to prevent lateral and rotatory movements. In man the outer malleolus is formed by the fibula, the inner by the tibia; and each forms a sort of pulley or trochlea around which wind the tendons of important extensor muscles of the foot. The malleoli are little distinguished in most animals, owing to the different set of the foot upon the leg, or the different configuration of the parts. When, as often occurs, the fibula does not reach the ankle, the outer malleolus is wanting unless formed by the tibia. In birds the condyles of the tibia, constituted by ankylosis of proximal tarsal bones, take the name and place of malleoli.

2. In *bot.*, a layer; a shoot bent into the ground and half divided at the bend, whence it emits roots. *Lutley*. — 3. [*cap.*] In *conch.*, a genus of bivalve shells. *J. E. **malleus** (mal'-ē-us), *n.*; pl. *mallei* (-ī). [NL., *<* L. *malleus*, a hammer, a mall; see *mail*¹.] 1. In *anat.*, the proximal element of Meckel's car-

tilage, in any way distinguished from the rest of the mandibular arch. In man and other mammals the malleus is separately ossified, and is the outer one of the three bonelets or ossicles of the ear lodged in the cavity of the tympanum, connected with the ear-drum or tympanic membrane, and movably articulated with the incus. It is named from its hammer-like shape in man, having a head, neck, and handle or short process, together with a processus gracilis, which lies in the Glaserian fissure. As one of the ossicula auditus, the malleus subserves the function of hearing in mammals. In birds, and many other vertebrates below mammals, the malleus has a very different office, that of forming part of the suspensorium of the lower jaw, which is its true morphological character. Its specialization in *Mammalia* is peculiar to that class. See *Malleifera*, and cuts under *hyoid*, *ear*, and *tympanic*.

2. In *ichth.*, one of the Weberian ossicles which form a chain between the air-bladder and the auditory apparatus in the skull of plectospondylous and nematognathous fishes. It is homologous with the hemapophysis of the third one of the coalesced anterior vertebrae. — 3. In rotifers, one of the paired calcareous structures within the pharynx. In the typical forms it is a hammer-like body, consisting of an upper part or head, called the *incus*, and a lower part or handle, named the *manubrium*, but in other forms the distinction disappears.

4. [*cap.*] In *conch.*, a genus of pearl-oysters of the family *Ariculidae*, founded by Lamarck in 1799; the hammer-shells. They have a long-winged hinge at right angles with the length of the valve, giving a hammer-like shape, whence the name. Young shells are like those of *Aricula* or wing-shells, and have a byssal notch; the hammer shape is gradually acquired with age. *M. vulgaris*, the hammer-oyster, inhabits Eastern seas. See cut under *hammer-shell*.

They are known as *bird-lice*, and are very numerous and diversiform. By some they are regarded as *Hemiptera* degraded and distorted by parasitism, and placed with the true lice in a group *Parasita* or *Anoplura*; by others they are held to constitute a superfamily or suborder of *Pseudoneuroptera*, and by others again a suborder of *Corrodentia*. See *louse*¹.

**mallophagan** (ma-lof'-ā-gan), *a. and n.* [*<* NL. *Mallophaga* + *-an*.] I. *a.* Same as *mallophagous*. II. *n.* A louse of the group *Mallophaga*.

**Mallophagidae** (mal-ō-faj'-ī-dē), *n. pl.* [NL., *<* *Mallophaga* + *-idae*.] The mallophagous insects regarded as a family of *Pseudoneuroptera*, and corresponding to the suborder *Mallophaga*. They differ from true lice in having mandibulate instead of suetorial mouth-parts, and in other respects. Most of them live on the plumage of birds, whence the name *bird-lice* for the whole of them; but some also infest the pelage of mammals. Some are great pests of the poultry-yard and aviary. The genera are numerous, including *Nirvanus*, *Trichoctes*, and *Goniodites*.

The flowers are apetalous, either dioecious or monoecious. The plants are trees or shrubs with generally alternate leaves. The male flowers are generally small, on short pedicels in heads along a rachis; the pistillate ones fewer, on long or short pedicels. There are about 70 species, numerous in eastern India, the Malay archipelago, and Australia, with a few in Africa. One species, *M. Philippinensis*, yields the dyestuff known as *kamila*.

See *malin brick*, below.

To the north-west, north, and east of the village (of Selborne) is a range of fair enclosures, consisting of what is called a white *malm*, a sort of rotten or rubble stone, which, when turned up to the frost and rain, moulders to pieces, and becomes manure to itself.

2. [*cap.*] The name used in Germany, and frequently by geologists writing in English on the geology of that country, for the uppermost of the three divisions of the Jurassic series, all of which at an early day received English provincial names, namely *Lias*, *Dogger*, and *Malm*.

The Malm of the German geologists (which is not the equivalent of the English malm rock) corresponds paleontologically with the Middle and Upper Oolite of England. The rock consists mostly of white limestone, with dolomitic and marly strata, and is in some places over 1,000 feet thick.

See *malm*.—**Malm rock**, the local name of parts of the Upper Greensand, as developed from Westerham west through Surrey, Hants, and Sussex. Also called *malmstone*.

Near Westerham we find harder beds below, which rapidly acquire importance farther west, and become there the chief part of the formation (the Upper Greensand). These beds are known as freestone and *malm rock*, and there also occur smaller quantities of blue gray and chert. The freestone is a light-colored calcareous sandstone much used for building. The *malm rock* much resembles it, but is slightly more chalky-looking.

It is characterized by a 5-parted calyx, some or all of the sepals usually with two glands, by having three carpels, which are either united or distinct, and by solitary ovules without albumen. The order embraces 52 genera and about 600 species, most numerous in the tropics. **Malpighian** (mal-pig'i-an), *a.* [< *Malpighi* (see def.) + *-an*.] Of or pertaining to Marcello Malpighi (1628-94), an Italian anatomist and physiologist: applied in anatomy to several structures discovered or particularly investigated by him, as follows.—**Malpighian body**, one of the glomeruli of the kidney surrounded by its capsule. These form the terminations of the branches of the uri-

niferous tubules, occur in the cortical substance of the kidney, and are about 1/2 of an inch in diameter. They are formed of the expanded end of the tube magnified by the bunch of blood vessels constituting the glomerulus, which thus are embraced in a double epithelial sac, and the blood is separated from the lumen of the tubule by the vascular wall and the epithelium of the inner layer of the capsule. There is reason to think that these bodies do most of the secretion of the water and less important salts of the urine, the remainder of the work of secreting the urine being done by the epithelial cells of the uriferous tubules.—**Malpighian cæca** or **filaments**. Same as *Malpighian tubes*.—**Malpighian capsule**. See *Malpighian body*.—**Malpighian corpuscle**. (a) A Malpighian body of the kidney. (b) A lymphoid corpuscle of the spleen. They are coiled convoluted tubes, immediately behind the posterior aperture of the stomach, and are generally regarded as representing the liver. See cut under *Blattella*.—**Malpighian tuft**, the glomerulus, or vascular network or plexus, in a Malpighian body.

It is characterized by having ten stamens, usually all perfect, and often with appendaged anthers; by three styles, which are almost always distinct; and by having carpels inserted on the flat receptacle, distinct or united in the fruit, and forming fleshy or woody drupes with from one to three cells.

Grain in which, by partial germination, arrested at the proper stage by heat, the starch is converted into saccharine matter (grape-sugar), the unfermented solution of the latter being the sweet-wort of the brewer. By the addition of hops, and the subsequent processes of cooling, fermentation, and clarification, the wort is converted into porter, ale, or beer. The alcoholic fermentation of the wort without the addition of hops, and distillation yield crude whisky. barley is the grain most used for malting in the manufacture of beer; but wheat, rye, and other grains are largely malted for whisky. Barley yields about 92 per cent. of its weight of dried malt.

**malt<sup>1</sup>** (mált), *v.* [*< malt<sup>1</sup>, n.* **I. trans.** To convert (grain) into malt. The steps in the process of malting are four: First, steeping in water from twenty-four to forty hours, by which the grain takes up from 10 to 30 per cent. of water, swells, and begins to germinate. Second, couching, in which the steeped grain is piled in heaps on a floor, usually made of flagstones, and wherein the growth of the rootlets is aided by heat generated in the mass. Third, flooring, in which the germinating grain is spread upon a floor in charges called *floors*, and stirred to expose it to air, and in which the growth of the rootlets is checked and the germination of the acrospires is carried to the desired limit. Fourth, drying, in which the germination is completely arrested by heat in a malt-kiln. The maltster decides, from the length and appearance of the acrospires as to when the conversion of the starch has been carried to the right limit. The dried acrospires and the rootlets are broken off by hand in the kiln, and are removed by sifting. The chemical changes effected by the partial germination and subsequent treatment of the grain are chiefly the conversion of the azotized substances into diastase, the conversion of the starch into grape-sugar by the action of the diastase, and the imparting of color and flavor to the malt in the kiln. The malt is either pale or dark in color, according to the degree of heat and the length of time it is exposed to heat in the kiln; and a peculiar flavor is derived from empyreumatic oil generated in the husk.

As a remedy he advocated the principle that society should aim to diminish the sum of vice and misery, and check the growth of population, by the discouragement of early and improvident marriages, and by the practice of moral self-restraint.

They are tall or low herbs, with leaves which are divided, or entire and cordate, and scarlet, orange, or yellow flowers, which are axillary or grow in terminal spikes. (Haworth, 1812), so called in allusion to the protuberances on the stem; < *L. mamilla*, breast, nipple; see *mammilla*.] A genus of *Cactaceæ*, the cactus family, and of the tribe *Echinocactæ*. It is characterized by a short stem, with the flowers in the axils of the tubercles, which are mamiform, elongated or angular, rarely uniting to form a fleshy ridge, and have a cushion-like apex, bearing a tuft of radiating spines; the flowers are usually arranged in a transverse zone, and have an immersed smooth ovary. About 300 species are known, natives of Mexico, though some are found in the southern part of the United States, Brazil, Bolivia, and the West Indies. The plants rarely exceed 6 or 8 inches in height. The stems are simple, tufted, globose, or cylindrical, and covered with tubercles, from the axils of which arise a zone of white, yellow, red, or rose-colored flowers, which remain open during the day only, and are frequently large and showy. **mamma**<sup>2</sup> (mam'i), *n.* [*L. mamma* (> It. *mamma* = Sp. Pg. *mama*, *L.* dim. *mamilla*, > F. *mamelle* = AS. *mamma*) = Gr. *μαμή*, the breast, pap. See *mama*.] 1. Pl. *mamma* (-ē). The mammary gland and associated structures; the characteristic organ of the class *Mammalia*, which in the female secretes milk for the nourishment of the young; a breast or udder. The mamma is essentially a conglomerate gland, consisting of lobes and lobules, secreting milk, which is conveyed from the ultimate ramifications of the organ by a system of converging lactiferous or galatophorous ducts, to be discharged through one or several milk outlets at the summit of the gland, where is the nipple or *mamilla*. The mamma is subcutaneous, and may be regarded as a highly developed and specialized sebaceous follicle. *Mammæ* vary much in number and position; they may be 2, 4, 6, 8, to 12 or more, usually an even

number, being paired, and may be pectoral, axillary, ventral or abdominal, or inguinal. They are sometimes quite high on the sides of the animal, but are never dorsal. An apparently single and median mamma, as the udder of the cow, results from the coalescence of as many mammae as there are teats. In marsupials they are contained in the pouch, and may be circularly or irregularly disposed, or of odd number. In monotremes they are devoid of a nipple, whence the name *Amusia* for these animals. The mamma develops at puberty, and comes into functional activity during gestation. The structure is common to both sexes, but as a rule remains rudimentary and functionless in the male.

2. [*cap.*] A genus of sea-snails of the family *Naticidae*. *Klein*, 1753.

**mammal** (mam'al), *n.* and *n.* [= OF. *mammal* = Sp. *mamul* = Pg. *mamul*, *mammal* = It. *mammale*, *n.*; < NL. *mammale*, a mammal, neut. of LL. *mammalis*, of the breast, < L. *mamma*, the breast: see *mamma*<sup>2</sup>.] 1. *n.* Having breasts or teats; mammiferous.

II. *n.* An animal of the class *Mammalia*.—**Aerial mammals**, the bats.—**Age of mammals**, the Tertiary period in geology.

**Mammalia** (ma-mā'lii), *n. pl.* [NL. (se. *animalia*), neut. pl. of LL. *mammalis* (neut. sing. as a noun, *mammale*), of the breast: see *mammal*.] In *zool.*, the highest class of *Vertebrata*, containing all those animals which suckle their young, and no others; mammiferous animals; the mammals. With the exception of the lowest subclass, the monotremes or *Ornithodelphia*, which lay eggs like birds, *Mammalia* are viviparous, bringing forth their young alive; and, with the same exception, the mammary gland is provided with a nipple for the young to suck. They have no gills, but breathe air by means of lungs, which are primitively an offset of the alimentary canal. The blood is warm; the heart is completely four-chambered or quadrilocular, with two auricles and two ventricles; and its right and left sides are entirely separate after birth, when the arterial and venous circulation and the pulmonary and systemic vessels become differentiated. The heart and lungs are situated in the thoracic cavity, which is completely shut off from the abdomen by a muscular diaphragm. The aorta is single and sinistral, curving over the left bronchus. The blood contains red circular non-nucleated blood-disks and white blood-corpuscles. The brain has large cerebral hemispheres, which are more or less extensively united by commissures, especially by a corpus callosum, which when well developed roofs over more or less of the lateral ventricles. The skull has two occipital condyles and an ossified basioccipital. The lower jaw, composed of a pair of simple mandibular rami, is directly articulated by a convex condyle with the glenoid fossa of the squamosal. The malleus and incus become specialized auditory ossicles, lodged like the stapes in the cavity of the tympanum. (See *Mallefera*.) Limbs are always present. There are ordinarily two pairs, anterior and posterior, or pectoral and pelvic, but the latter are sometimes aborted, as in cetaceans and sirenians. The ankle-joint, if there is one, is always formed between crural and tarsal bones, and is never mediotarsal. The body is usually more or less hairy, sometimes naked, rarely scaly or with a bony exoskeleton. The class *Mammalia* is definitely circumscribed, no transitional forms being known. It has been subdivided in various ways. Linnaeus had 7 orders, *Primates*, *Bruta*, *Feræ*, *Glires*, *Pecora*, *Beluæ*, and *Cete*, with 40 genera in all. Cuvier made the 9 orders *Bimana*, *Quadrimana*, *Carnaria*, *Marsupialia*, *Rodentia*, *Edentata*, *Pachydermata*, *Quadrumania*, and *Cetacea*. Owen divided *Mammalia* primarily into 4 subclasses, according to the character of the brain, and 14 orders, as follows: *Archcephala*—*Bimana*; *Gyrocephala*—*Quadrimana*, *Carnaria*, *Artiodactyla*, *Perissodactyla*, *Proboscidea*, *Sirenia*, *Cetacea*; *Lisencephala*—*Bruta*, *Chiroptera*, *Insectivora*, *Rodentia*; *Gyrocephala*—*Marsupialia*, *Monotremata*. Dana's prime divisions correspond to Owen's by other names, *Archontia*, *Measthena*, *Microstheia*, and *Otiodontia*. In 1872 Gill arranged mammals in 3 subclasses and 14 orders, as follows: subclass *Monodelphia*, containing all placental mammals, orders *Primates*, *Feræ*, *Cynipedia*, *Toxodontia* (fossil), *Hyrcocidea*, *Proboscidea*, *Sirenia*, *Cete*, in one series *Eduecabilia*, and *Chiroptera*, *Insectivora*, *Glires*, *Bruta*, in a second series *Induecabilia*; subclass *Didelphia*, the implantal mammals, order *Marsupialia* alone; subclass *Ornithodelphia*, the oviparous mammals, order *Monotremata* alone. This is substantially the classification now almost universally current, but it is exclusive of certain fossil groups which require ordinal rank. The families of mammals now recognized are about 150 in number, the genera nearly 1,000; the living species are about 3,250. Remains of mammals abound in all Tertiary deposits, and a few forms have been found in Mesozoic beds. Also called *Mammifera* and *Mallefera*.

**Mammea** (ma-mē'ä), *n.* [NL. (Linnaeus, 1757), < Haytian *mamey* (> Sp. *mamey*).] A genus of dicotyledonous polypetalous trees of the natural order *Guttifera* and tribe *Calophylleæ*, characterized by a calyx which is closed before the flower expands, and then becomes valvately 2-parted, and by a 2- to 4-celled ovary containing four ovules, usually with a peltate stigma. They are trees with rigid coriaceous leaves, often covered with pellucid dots; axillary flowers, either solitary or in clusters; and fruits which are indehiscent drupes with from one to four large seeds. There are 5 species, natives of America and tropical Asia and Africa. *M. Americana* is a tall tree with a thick spreading head, somewhat resembling *Macropia grandiflora*, and showy white sweet-scented flowers. The fruit, known as the *mamee-apple* or *South American apricot*, is much esteemed in tropical countries, and is eaten alone, or cut in slices with wine or sugar, or preserved in various ways. It is yellow, and as large as a coconut or small melon; the rind and the pulp about the seeds are very bitter, but the intermediate portion is sweet and aromatic. From the flowers a spirituous liquor is distilled. (See *eau Cade*, under *eau*.) The seeds, which are large, are used as anthelmintics, and a gum distilled from the bark is used to destroy chigoes. The tree is a native of the West Indies and tropical America, but is often cultivated in the tropics of the Old World.

Dict.).] 1. *n.* An extinct species of elephant, *Elephas primigenius*. It is nearly related to the existing Indian elephant, having teeth of similar pattern, and is believed to have been the ancestor of this species; but it was thickly covered with a shaggy coat of three kinds, long stiff bristles and long flexible hairs being mixed with a kind of wool. This warm covering enabled it to endure the rigor of winter in its native regions. The tusks were of great size and much curved. An entire mammoth was discovered in 1799 by a Tungusian fisherman named Schumachoff, embedded in the ice on the banks of the river Lena in Siberia, in such complete preservation that its flesh was eaten by dogs, wolves, and bears. It was about 9 feet high and 16 feet long, with tusks 9 feet long measured along the curve. In later years the bones and tusks of the mammoth have been found abundantly in Siberia, and the fossil ivory has been of great commercial value. This article had been known for many centuries before the discovery of the animal itself, and the mammoth is now supposed to have ranged, before, during, and after the glacial epoch, over the greater part of the northern hemisphere. That it was contemporary with prehistoric man is shown by the discovery of a drawing of the animal scratched on a piece of its own ivory found in a cave in France. This species is more expressly known as the hairy mammoth. The name *mammoth* is extended to other fossil elephants of the same genus or of the subfamily *Elephantinae*, but is not applicable to the mastodons, of the subfamily *Mastodontinae*.

**man** (man), *n.*; pl. *men* (men). [*Also dial. man; < ME. man, man, pl. men, < AS. man, man, mann, mona (pl. men, man), also rarely manna, monna (pl. manna, monna) = OS. man = OFries. man, mon = D. man = MLG. man, LG. mann = OHG. MHG. man, G. mann = Icel. manna, also rarely manni (in comp. manna; nom. orig. \*manir) = Sw. man = Dan. mand = Goth. manna (mannan-, mann-, man-), a man (L. vir), a human being, a person (L. homo), in the latter use becoming in AS. man, man, ME. man, men, m = D. men = OHG. MHG. G. man = Sw. Dan. man = Goth. manna, merely pronominal, 'one' (cf. F. on, 'one,' < L. homo, a man), esp. with a negative (Goth. ni manna = G. ni mand, no one; G. j. mand, any one); Teut. stem in three forms, manan-, mannan-, and man-, as shown in Goth. and Icel. (the third form man- existing in Goth. gen. sing. and nom. and acc. pl. mans, and prob. also in Icel. man, neut., a bondman, bondwoman, girl); the earlier man- being for \*man-, \*mann- (cf. chin, < AS. cin, \*cinn = Goth. kinnus = Gr. χένος; min<sup>2</sup>, ult. < \*mnan- = Gr. mnen) = Skt. manu, man (Manu, the mythical father of the human race (cf. OFeut. in L. form *Mannus*, mentioned by Tacitus as a deity of the ancient Germans)), with deriv. mānusha, man. Cf. OBalg. man'zhi (orig. \*monzhi) = Bulg. mǎch = Sloven. mǎch = Serv. Bohem. mǎch = Pol. mǎch = Little Russ. mǎch = Russ. mǎch, a man, husband (> Russ. mǎchik, a peasant). Not found in Gr., nor in L., unless it be = L. mas (mar-), a male (if that stands for orig. \*mans, > ult. E. mal<sup>2</sup>, masculine, marital, marry), etc.; see these words. The ult. origin of the Teut. and Skt. word is unknown. It is usually explained as lit. 'the thinker,' < √ man, think (> ult. E. mind<sup>1</sup>, man<sup>1</sup>, L. men(t)-s, mind, > E. mental, etc.); but that primitive men should think of themselves as 'thinkers' is quite incredible; that is a comparatively modern conception. Another derivation, referring to L. manere, remain, dwell, is also improbable. It is not likely that any orig. significant term old enough to have become a general designation for 'man' before the Aryan dispersion would have retained its orig. significance. The E. man retains the senses of L. vir and homo; in D. G. Dan. the word cognate with E. man means vir, while a derivative, D. G. mensch, Dan. menneske, etc., means homo; see mensk, manish. The irreg. pl. of man is due to original *i*-umlaut, the AS. pl. men, man, being orig. \*manni, changed to *man* by umlaut, and then abbr. to *men*, *men* by loss of the final vowel, the radical vowel, thus accidentally changed in the plural, coming to be significant of number. A similar change appears in *fact*, *geese*, *mice*, etc., pl. of *foot*, *goose*, *mouse*, etc.] 1.*

In *zool.*, a featherless plantigrade biped mammal of the genus *Homo* (which see); *H. sapiens*, a species of the family *Hominidae* or *Anthropoda*, order *Primates*, class *Mammalia*, of which there are several geographical races or varieties. Blumenbach divided mankind into five varieties: (1) *Caucasian*, having a white skin; (2) *Mongolian*, having an olive skin; (3) *Ethiopian*, having a black skin and black eyes; (4) *American*, having a dark skin more or less of a red tint; (5) *Malay*, having a brown or tawny skin. Professor Huxley has divided man into five groups: *Australoid*, *Negroid*, *Mongoloid*, *Xanthochroic*, and *Melanochroic*; and there are many other divisions, on linguistic or physical grounds, or both, but none that has no general or wide acceptance.

The American manatee, to which the name was originally given, and to which it specially pertains, is *Manatus americanus*, *australis*, or *latirostris*, whether of one or two species. The manatee inhabits the shallow waters of rivers and estuaries on the eastern coast of tropical and subtropical America, from Florida and some of the West India islands to about lat. 20° S. stretched over an almond-shaped body, and a neck with numerous frets. It is played with a plectrum of tortoise-shell held in the right hand. **2.** [*cap.*] A genus of plants of the natural order *Solanaceae*, the nightshade family, and tribe *Litropceae*. The corolla is induplicate in the bud, the calyx is foliaceous and five-parted, and the pedicels are partially clustered among the radical leaves. They are herbs, nearly stemless rising from a thick, fleshy, often forked root, and bear tufts of large, ovate, lance-shaped leaves, and quite large pale bluish-violet, white, or purple flowers, which are reticulately veined. Five species have been described (but these may be reducible to one), found throughout the Mediterranean region. The ordinary plant has been commonly known as *M. officinalis*, but this includes a spring and a fall kind sometimes separated as species *M. cernalis* and *M. autumnalis*. The mandragora or mandrake has long been known in medicine, and has been the subject of much superstition. See *mandrake*.

**mandrake** (man'drāk), *n.* [*< ME. mandrake*, *mandrake*, *mandrake*; an alteration, appar. simulating *drake*<sup>2</sup>, of earlier *ME. mandrag*, *mandrag*, short for *mandragora*, *q. v.* To the

peculiar form of the root, and the suggestive form of the name *mandrake*, appar. a compound of *man* + *drake*<sup>2</sup>, with little meaning attached to the supposed second element, are due in large part the superstitions associated with the plant.]

1. A plant of the genus *Mandragora*. The mandrake has poisonous properties, and acts as an emetic, purgative, and narcotic. It was in use in ancient times especially for its narcotic effects, and is said to have been employed as an anesthetic. It has been regarded as an aphrodisiac, and used in amorous incantations, as a love-amulet, etc. According to an old fancy the mandrake shrieks when pulled from the ground. The resemblance of its commonly forked root to the human body is probably the ground of this superstition, as well as of the reputed of the plant as an aphrodisiac.

Flowering Plant of Mandrake  
(*Mandragora officinalis*).

And Reuben went in the days of wheat harvest, and found *mandrakes* in the field, and brought them unto his mother Leah. Gen. xxx. 14.

And shrieks, like *mandrakes* torn out of the earth,  
That living mortals, hearing them, run mad.

Shak., R. and J., iv. 3. 47.

The *mandrake*, a plant with broad leaves and bright yellow flowers and with a root which grew in a semi-human form, was found beneath the public gallows and was dragged from the ground and carried home with many extraordinary ceremonies. When secured, it became a familiar spirit speaking in oracles if properly consulted, and bringing good luck to the household in which it was cherished. C. Elton, *Origins of Eng. Hist.*, p. 220.

The best digest of the various speculations as to the *mandrake* and its properties will be found in Dr. Harris's "Dictionary of the Natural History of the Bible." N. and Q., 7th ser., VIII. 220.

## 2. The May-apple, *Podophyllum peltatum*, [U.S.]

The bluish-pearl peach and glossy plum there lies,

And with the *mandrake* tempt your hands and eyes.

Jane Turrell, quoted in Tuckerman's *America and her Commentators*, p. 33.

3. In *her.*, a figure resembling a root with two long and pointed bifurcations usually twisted together, and the whole crowned with leaves and berries.

**mandrel, mandril** (man'drel, -dril), *n.* [An alteration of *mandrin*, < F. *mandrin*, a mandrel, former, strike, perhaps < L. *mandra*, a stall, < Gr. *πάριον*, a stall, the bed in which the stone of a ring is set; see *mandrigal*.] 1. In *mech.*, a cylindrical bar or spindle, either of uniform diameter, of different diameters, or tapered, used for a variety of purposes, but chiefly for the support of objects formed with holes, into which the mandrel is forcibly driven in order to hold them firmly while turning in a lathe, or in an analogous machine, or in operating upon them with a file. Specifically—(a) An axis attached to the head-stock of a lathe, to support, during the process of turning, any material which is bored or pierced with a central hole. It has often some adjustable device for securing it to the material, and is then known as an *adjustable mandrel*. (b) Any arbor or axis to support a tool, as a mandrel for a circular saw or circular cutter. (c) A rod or former for shaping forgings, or a plug-core for metal or glass castings.

2. A miners' pick. [Eng.]—3. In *metal-working* by the spinning process, the form, usually of wood, upon which the thin plate of metal or blank is pressed in order that the revolution may give it the form of the mandrel.—**Adjustable mandrel**. See def. 1 (a).—**Expanding mandrel**, a mandrel constructed to engage and firmly hold a piece of material on the inside of a hole of uniform diameter, for turning, etc. Such mandrels are of various construction. A common form is a central arbor having grooves with inclined plane bottoms in which move simultaneously and equally tapered key-slides, the outer sides of which are always parallel with each other and with the axis of the arbor. When moved longitudinally, these slides expand against the inside of the hole with force, holding the piece by jamming friction.—**Flexible mandrel**, a spiral spring placed in a metal tube to prevent it from flattening or collapsing when bent.—**Hicks's mandrel**, an expanding mandrel for turning rings, named from its inventor. It is an arbor with a cone in the middle, in the periphery of which, at equal distances from each other, are formed longitudinal dovetailed grooves carrying wedge-shaped slides actuated simultaneously and equally by a nut on the end of the cone, and thus expanded to fit the bore of the ring to be turned.—**Traversing mandrel**. (a) A mandrel which moves longitudinally. (b) A mandrel fitted to a bearing or bearings of a support which may be set in the tool post of the slide-rest of a lathe, or in some other traversing device. Such mandrels are used for expanding reamers and analogous tools, and they are usually driven by a pulley-and-belt mechanism.

**mandrel** (man'drel), *v. t.* [*mandrel*, *n.*] To operate upon with mandrels, as a bronze gun. This is done by driving steel mandrels of gradually increasing size through the bore, whereby the strength of the gun is greatly increased, the limit of elasticity being in some cases nearly or quite doubled.

**mandrel-collar** (man'drel-kol'är), *n.* A collar formed on the mandrel of a lathe, against which the chucks, face-plates, etc., abut squarely when screwed upon the mandrel-nose.

**mandrel-frame** (man'drel-främ), *n.* A frame or head-stock secured by bolts to the end of a lathe-bed to support the mandrel.

**mandrel-lathe** (man'drel-läth), *n.* A lathe adapted for turning long work and hollow work. It is so designed that the material for hollow work can be clamped by a chuck on the end of the mandrel in the head-stock. Long work is supported in the lathe by the head and tail centers. E. H. Knight.

**mandrel-nose** (man'drel-nöz), *n.* The inner end of a lathe-mandrel, upon which a screw-thread is formed for receiving and holding face-plates, chucks, etc.

**mandrel-screw** (man'drel-skrö), *n.* The screw on the mandrel-nose to which chucks, face-plates, etc., are fitted, and by which they are attached to the mandrel.

**mandril**, *n.* See *mandrel*.

**mandrill** (man'dril), *n.* [= F. *mandrill* = Sp. *mandril* = It. *mandrillo*, a mandril; said to be from a native W. African name. If this form is original, the form *drill* in same sense is due to a false division of the word, as if < E. *man* + *drill*; see *drill*]. If *drill* is original, the form *mandrill* is an E. compound, and the F. Sp. It. forms are from E.] A kind of baboon; the great blue-faced or rib-nosed baboon; the hog-ap, *Cynocephalus matmon* or *marmos*, the largest and most formidable, ferocious, and hideous of baboons. The canine teeth are of enormous size, causing a protuberance of the cheeks, which are naked and fantastically striped with brilliant colors. The ischial callosities are of great size and bright-red color. The animal is often seen in captivity. The mandrills are natives of the western coast of Africa, where they associate in large troops, which are the terror of the negroes. They often plunder villages and cultivated fields with impunity. See *ent* under *baboon*.

It is gravel in the teeth, and a man must drink the blood of his own gums when he *manducates* such unwholesome, such unpleasant fruit. Jer. Taylor, *Works* (ed. 1835), I. 719.

**manducation** (man'dü-kä'shun), *n.* [= F. *manducation* = Sp. *manducacion*, < L. *manducatio* (n.), a chewing, < L. *manducare*, chew; see *manducate*.] The act or process of biting or chewing; mastication.

Ch.*, a kind of large and loose mantle, resembling a cope, fastened at the throat and sometimes at the lower corners also, and reaching almost to the feet. It is worn by monks and nuns, by archimandrites, and at times by bishops who were regularly appointed from the monastic orders. The mandyas of a prelate has wavy stripes upon it, while that of an archimandrite is plain.

When, as in the horse, it grows on the middle line of the back of the neck, the mane commonly falls on one side, but it may be stiff and erect. In the lion the long and shaggy mane covers the whole neck and part of the fore quarters.

Thin mane, thick tail, broad buttock, tender hide;

**man-eater** (man'ē'tēr), *n.* 1. A cannibal.—2. In India, a tiger that has acquired a taste for human flesh; a tiger supposed or known to have a special propensity for killing and eating human beings. The name is sometimes extended to the lion and the hyena, on the same supposition.

The regular *man-eater* is generally an old tiger whose vigour is passed, and whose teeth are worn and defective; it takes up its abode in the neighbourhood of a village, the population of which it finds an easier prey than the larger or wilder animals. W. H. Flower, *Encyc. Brit.*, XXIII. 386.

3. One of several kinds of large sharks supposed to be specially formidable to man; specifically, *Carcharodon rondeleti*, a very large shark of the family *Lamnidae*. This shark has straight narrow triangular teeth, very slightly serrated or crenulated, in both jaws. The body is stout and fusiform, with a pointed snout; there are two dorsal fins, one large, between the pectorals and the ventrals, the other small and posterior; the anal fin is like the second dorsal; the caudal fin is crescentiform; and there are five branchial apertures, all in front of the pectorals. It has been found to feed long, though it averages so much less than 13 feet is a good size. It is a shark of the high seas, found in nearly all tropical waters, frequently passing a considerable distance both northward and southward. Teeth much like those of the living species have been found in the Pliocene and Miocene deposits, as well as in the ooze of the Pacific ocean, indicating individuals that must have been about 50 feet long.

4. The dobson or hellgrammite. [Local, U. S.]

**maneless** (män'les), *a.* [*< mane* + -less.] Having no mane; as, the *maneless* lion of Guzerat, a recognized variety of *Panthera*.

**man-engine** (man'en'jin), *n.* A form of elevator or power-ladder used in some deep mines for raising and lowering men. In its usual form it is essentially a vertical rod extending from the surface to the bottom of the mine, and reciprocated upward and downward, like a pump rod, by means of a steam-engine or a water wheel. The length of stroke commonly adopted is 12 feet, and at intervals equal to the stroke platforms are fastened to the rod, with corresponding pulleys in the shaft, on either side of the rod, at points corresponding to the limits of the stroke, both upward and downward. A man in descending steps on a platform on the rod just as the down stroke begins, and steps off on the platform at the shaft which he reaches at the end of the stroke, repeating the operation until he attains his destination. An ascending operation on a platform of the rod is the up stroke begins, and leaves it at the end of the stroke. Ascent and descent may proceed simultaneously without

interruption, the fixed platforms on one side of the shaft being reserved for men ascending, and those on the other side for men descending, each man stepping on his proper platform on the reciprocating rod as it is vacated, at the moment of rest between the strokes, by the man who is traveling in the opposite direction. This is the form of man-engine used in Cornwall. That employed in the Harz mines (where the method originated) is the "double-rod engine," with two rods moving up and down alternately in opposite directions. This contrivance corresponds to a ladder with movable steps, the miner having nothing to do but to move slightly sidewise in order to place himself on the step which is about to go up or down, according as he wishes to ascend or descend. In the United States cages, and in some mines man-cars, are used instead of man-engines. See *man-car*.

**manent** (ma-nent), [*L.* 3d pers. pl. pres. ind. of *manere*, remain: see *remain*.] They remain (on the stage): a stage direction. Compare *manet*.

**manes** (mä'néz), *n. pl.* [*L.*, prob. < *OL*. *manis*, *manus*, good.] 1. In *Rom. anth.*, the spirits of the dead considered as tutelary divinities of their families; the deified shades of the dead, according to the belief that the soul continued to exist and to have relations with earth after the body had perished. Three times a year a pit called the *manus* was officially opened in the comitum of the Roman Forum, to permit the manes to come forth. The manes were also honored at certain festivals, as the Parentalia and Feralia; oblations were made to them, and the flame maintained on the altar of the household was a homage to them. [In this sense often written with a capital.]

The most special representatives of ancestor-worship in Europe were perhaps the ancient Romans, whose word *manes* has become the recognized name for ancestral deities in modern civilized language; they embodied them as images, set them up as household patrons, gratified them with offerings and solemn homage, and, counting them as or among the infernal gods, inscribed on tombs D. M., "Dis Manibus."

E. B. Tylor, *Prim. Culture*, II, 109

It is manufactured for use in the Bessemer process, and is an important adjunct to that operation. The object of the addition of the manganese at the termination of the "blow" is the removal of the oxygen in the iron, without at the same time adding carbon and silicon. This vitally important improvement of the Bessemer process is due to the Scotch metallurgist R. F. Mushet. See *steel* and *spiegel*.

**manganesate** (mang-ga-nē'sāt), *n.* [*< mangan* (see) + *-ate*<sup>1</sup>.] Same as *manganate*.

**manganese** (mang-ga-nēs' or -nēz'), *n.* [= *F.* *manganèse* (> *Sp.* *Pg.* *manganesa* = *It.* *manganese*), < *NL.* *manganesium*, an arbitrarily altered form of *magnesium*, a name first given to this metal, but now used for a different metal; see *magnesium*.] Chemical symbol, Mn; atomic weight, 55.

A metal having a remarkable affinity for, and in some respects a close resemblance to, iron, of which it is an extremely frequent associate. It differs from iron, however, in that it is not used at all by itself in the arts, although of great interest and importance as connected with the manufacture of iron, and as modifying by its presence in small quantity the character of the product obtained. The use of the black oxide of manganese for removing the coloring matters from glass was known to the ancients, and is mentioned by Pliny, but the nature of the material thus used was not understood until quite modern times. This ignorance was shown in the confusion of the oxide of manganese with the magnetic oxide of iron, the lodestone (Latin *magis* and *magnus lapis*), and the former was called *magnesia* by chemists in the middle ages, apparently in conformity with Pliny's idea of a dual (masculine and feminine) nature in some metals, manganese not having the attractive power of the magnet, and being on that account considered feminine. Other variants (in the fifteenth and sixteenth centuries) of the name of the ore used by glass-makers were *magnesia*, *manganosum*, and *manganensis*. After what we now call *magnesia* had received the name of *magnesia alba*, apparently from the idea that this substance was in some way related to the oxide of manganese, the latter began to be called *magnesia nigra*. From the middle of the eighteenth century the combinations of manganese were studied by various chemists, and finally, in 1774, the metal manganese was isolated by Gahn, but for years there was much confusion in regard to its specific name, and it was not until after the beginning of the present century that the name *manganese* (*mangan* in German) began to be generally adopted. The Latin termination in *-um* (*manganesium*) is rarely used in modern technical works. This metal has never been found native. As eliminated from its ores by chemical processes, it is grayish-white in color, resembling cast-iron, but varying considerably in hardness and luster according to the nature of the methods by which it was obtained. It is very hard and brittle, and has a specific gravity of about 8. It oxidizes rapidly on exposure to the air. Manganese resembles iron in that its ores are widely diffused and differs from that metal remarkably in the fact that, on the whole, its ores are only rarely found in considerable quantity in any one locality, while those of iron exist in abundance in many regions. The important ores of manganese are all oxides, and of these the peroxide (pyrolusite), called in commerce the *black oxide of manganese*, or simply *manganose*, is the most valuable and important. Other mangiferous minerals (all oxides) are braunite, hausmannite, psilomelane, and various earthy mixtures called *low-manganese*, *wad*, *cypreus manganese*, etc. Practically the ore called *manganose* in commerce is a mixture of various oxides, different samples differing greatly in value, which value has to be determined by chemical analysis. The ores and salts of manganese are of very considerable importance in chemical manufactures, both as bleaching and oxidizing reagents. The ma-

ture and importance of this metal in the manufacture of iron and steel will be found indicated under *steel* and *spiegel*.—**Earthy manganese**. See *wad*.—**Gray manganese ore**. Same as *manganite*.—**Manganese bronze**, an alloy said to be composed of ordinary bronze with the addition of manganese. It has the color of gun-metal, and its fracture resembles that of fine-grained steel. It is said to equal or excel in tenacity bar-iron of medium quality. It has been manufactured in England, but has not come into general use.—**Manganese brown**, green, violet, etc. See *brown*, etc.—**Manganese copper**. entire, coriaceous leaves, and polygamodioecious flowers, which are small, pinkish or yellowish, and grow in much-branched panicles. The fruit is a fleshy drupe, fibrous within, and usually with more or less of a turpentine flavor. There are about 30 species, natives of tropical Asia.

The mango, *M. indica*, grows abundantly in India, and is cultivated in many other tropical countries for its edible fruits, which are very highly esteemed. There are a great many varieties, differing in the flavor, size, and shape of the fruit. The unripe fruits are much used in India in preserves and pickles, in which latter state they are frequently exported; the ripe fruits, also, are much eaten. As formerly made, it consisted of an oblong rectangular wooden chest which rested upon two cylinders. The chest was loaded with stones to make it press with sufficient force upon the cylinders, and was moved backward and forward by means of a wheel and pinion, the rollers being thus made to pass over and thoroughly press the articles spread on a polished table underneath. Mangles of this construction have, however, been generally superseded by mangles which act in the manner of a calender or a clothes-wringer, the cloth to be smoothed being passed between one or more pairs of rollers.

1. A tree of the genus *Rhizophora*, chiefly *R. mucronata* (*R. Mangle*), the common mangrove, abounding on tropical shores in both hemispheres. It is a low tree of most singular habit, remarkable for a copious development of adventitious roots, which arch out from the lower part of the trunk, and at length descend from the branches; it is peculiar also in that its seed germinates in the fruit, sending down its radicle into the mud, sometimes a distance of several feet, before detachment from the parent. By these means the mangrove spreads thickly over the tidal mud, forming impenetrable and highly insular bogs, hundreds of miles in length. The wood is valuable for fuel, for piles, etc., and is susceptible of a beautiful polish. The astringent bark is useful in medicine and for tanning. The fruit is of a dry and coriaceous texture. See cut in preceding column.

2. Another plant of similar habit, especially a plant of the genus *Avicennia*. They are littoral trees, widely diffused in the tropics, throwing out a tangled mass of arching roots above ground, and sending up abundant asparagus-like shoots from the underground roots. The seed also germinates as it ripens. *A. officinalis* (including *A. tomentosa*), called *white mangrove*, extends to Australia and New Zealand, the mangawa of the Maoris, mistakenly reported to yield an aromatic gum. *A. nitida* of tropical America and Africa is the black or olive mangrove. In a mania in this strict sense there may be delusions, but they fall of the systematized character of those of paranoia. Delusions and hallucinations may also be present. The cases issue in recovery, in death by exhaustion and intercurrent disease, and a considerable proportion in permanent imbecility.

**II. n.** One of a religious body, adherents of Mani, Manes, or Manichæus, a native of Persia or some neighboring country, in the third century. Its doctrines and features were derived from Gnostic, Buddhist, Zoroastrian, and various other sources. These it attempted to combine with Christianity, and it is generally classed among Gnostic sects. Its theology was dualistic, representing the conflict between light and darkness, and including belief in the inherent evil of matter. Its morality was professedly ascetic, but profligacy of life and cruel or immoral ceremonial were generally attributed to it in both its earlier and its later forms. It had an organized priesthood, and recognized a distinction between its esoteric class (the "elect" or "perfect") and the "hearers." It originated in Persia, but soon extended into the Roman empire, and existed as late as the seventh century. The Manichæans, Abigines, Catharists, etc., developed it into new forms, retaining many of its features, and hence were styled "New Manichæans." The title *Manichean*, or *New Manichean*, was an epithet used opprobriously in the controversies of the middle ages.

The form is elongate, without apparent distinction of neck and tail. The whole aspect resembles that of a lizard, an appearance heightened by the remarkable large, flat, horny, overlapping scales which cover the upper parts in continuous series. The under parts are hairy; teeth are wanting; the hind feet are plantigrade and five toed, and the fore feet are also pentadactyl, but the digits are so shaped that the animal walks on its knuckles. The placenta is diffuse and non-deciduate. The family includes 6 or 8 species, referable to 3 genera, *Manis*, *Pholidotus*, and *Smutsia*. See *cut* under *pangolin*. The first five words agree in representing the object as though viewed with the eye. What is *clear* can be seen without dimness; what is *plain* can be seen by any one at the first glance, without search or study. *Evident* suggests something more of a mental process, but no difficulty in seeing that the thing is true. *Manifest* is a degree stronger than *evident*, the mind getting the truth as by an intuition. *Obvious* by derivation applies to that which lies so directly in our way that we cannot help coming upon it and seeing it; that which is *obvious* needs no pointing out or explaining. We speak of a *clear* case of self-deception; a duty that is *plain*; an *evident* mistake; a *manifest* misunderstanding; an *obvious* inference, not needing to be actually put into words.

He [Kant] . . . tells us in the *Analytic* that sense only presents to us a mere *manifold*, which requires to be bound together in the unity of a conception ere it can be apprehended as an object.

Thus space is the aggregate of all points, and each point is a specialization of the general notion of position. F. W. Frankland.

They are tall herbs or shrubs, with alternate leaves which are undivided or often palmately 3- to 7-lobed or -parted, and monocious apetalous flowers, which are quite large and grow in terminal or axillary racemes. There are about 50 species, all natives of tropical and subtropical America; several of them, however, are largely cultivated elsewhere. The genus is of great importance for the food-products derived from the roots of several species, especially *M. utilisima*, the bitter cassava, and *M. An artists' model of the human figure. See *lay-figure* and *manequin*. —4. A non-oscine passerine bird of the subfamily *Piprinae*. Manikins are generally small, thick-set, and of brilliant plumage; with few exceptions, they are natives of the hottest parts of America. They feed on vegetable and animal substances, and are lively and active in their movements. The bearded manikin, *Manacus manacus*, is black, with the breast, neck, and tuft of feathers on the chin white. The species are numerous, and the sexes are diverse in color and often in form, the males of many having curiously shaped wings or tail. 4. In the *Western Church*, one of the eucharistic vestments, consisting of a short, narrow strip, similar in material, width, and color to the stole. It is marked with a cross and generally embroidered and fringed. The maniple is worn by prelates, priests, deacons, and subdeacons, hanging from the left sleeve of the alb, fastened near the wrist, or attached by strings, pins, or a button. It is assumed by the celebrant after the alb and girdle, and before the stole. A bishop assumes it at the Indulgentium. In Anglican churches maniples are worn, as in the medieval church, three or four feet in length; in the Roman Catholic Church they are now much shorter. The maniple seems to have first come into use in the eighth century, and was originally a piece of white linen used as a handkerchief. Till the twelfth century and later it continued to be held in the hand. There is no corresponding vestment in the Eastern Church, though some writers have confounded the epimanikion with it. Other names formerly given to the maniple were *fanon* or *phanon*, *mantle*, *manutergium*, *mappula* or *mappa*, and *sudarium*.

And when the children of Israel saw it, they said one to another, It is manna [in the Vulgate: "Manna? quod significat? Quid est hoc?"] for they wist not what it was" (Ex. xvi. 14, 15), implying that the name thus arose from the question, Heb. mān hū, 'what is this?'; but this is doubtless a popular etymology. The name is otherwise referred to Heb. mān, a gift, Ar. manā, favor.] 1. The food by which the children of Israel were sustained in the wilderness (Ex. xvi. 14-36; Num. xi. 6, 7). The circumstances attending the gift of manna show that it was believed to be miraculous. Modern commentators differ in opinion as to its probable nature: by some it is identified with an exudation of the tamarisk tree, and by others with a lichen which, torn from its home and carried vast distances by the wind, still falls and is gathered for food in the Sinaiic peninsula (see *manna-lichen*); and by others it is regarded as a special and miraculous creation.*

4. In *phar.*, a sweet concrete juice obtained by incisions made in the stem of *Fraxinus Ornus*, a native of Sicily, Calabria, and other parts of the south of Europe, and from other species of ash. It is either naturally concreted or exsiccated and purified by art. At the present day the manna of commerce is collected exclusively in Sicily, where the manna-ash is cultivated for the purpose in regular plantations. The best manna is in oblong pieces or flakes of a whitish or pale-yellow color, light, friable, and somewhat transparent. It has a slight peculiar odor, and a sweetish taste mixed with a slight degree of bitterness, and is employed as a gentle laxative for children or persons of weak habit. It is, however, generally used as an adjunct to other more active medicines. It consists principally of a crystallizable sweet substance named *mannite*, and certain other substances in smaller quantity. Sweetish secretions exuded by some other plants growing in warm and dry climates, as the *Eucalyptus viminalis*, the manna-gumtree of Australia, and the *Tamarix Gallica*, var. *mannifera*, of Arabia and Syria, are also considered to be kinds of manna. Small quantities of manna, known as *Britannic manna*, are obtained from the common larch, *Larix Europaea*. — **Jews' or Hebrew manna, manna of Sinai.** (a) An exudation from the Jerusalem bush called *camel's-thorn*, *Athya camelorum* (including *A. **manometer** (mā-nom'ē-tēr), *n.* [= *F. manomètre = Sp. manómetro, < Gr. manō, rare, not dense, thin, loose, slack, few, scanty, + μέτρον, a measure.*] An instrument for determining and indicating the elastic pressure of gases or vapors. It measures the weight of a column of liquid or the tension of a spring that exactly balances the elastic pressure of the gas on a unit of area; and, since the relative density of a gas is proportional to its elastic pressure, the measurement of the latter determines also the former. Manometers which measure elastic gaseous pressure by the tension of a spring are used for steam-gages. In some forms the pressure of the gas is on a piston or diaphragm connected with a counterbalancing spring. In others the initial pressure is received on a small primary piston, or diaphragm, and transmitted by a fluid mass acting upon a secondary and much larger piston or diaphragm upon which the pressure per unit of area is reduced inversely as the area of the smaller piston is to that of the larger. Of this kind is Shaw's gage for measuring very high pressures. In the Bourdon steam-gage a curved tubular spring is used, having its interior connected by a tube with the interior of the tank, boiler, cylinder, or gas-holder containing the vapor or gas to be tested. In all of these forms the parts moved under varying pressure are connected with an indicator, and the pressure is read on a graduated dial plate. In the *open-air manometer* the elastic pressure of a gas is indicated by the height of a column of liquid, usually mercury or water, which it will support. In its simplest form an S-shaped glass tube, open at the upper end, is employed, as shown in the cut. In the *compressed-air manometer* the tube containing the liquid is closed at the top, and hence the varying elastic pressure of the confined air is added to the weight of the liquid column in balancing the gaseous pressure to be measured. The *static manometer* of Boyle has a thin glass bulb counterpoised on a pair of delicate scales, the specific gravity of the bulb and its confined air varying with both pressure and temperature of the surrounding air. The manometer of Ramsden is essentially a compressed-air manometer combined with a scale which indicates temperature while determining atmospheric density. The ordinary gas-gage is a simple open-air manometer.

2. In England, generally, a landed estate, especially one the tenure of which vests the proprietor with some particular rights of lordship; specifically, in *old law*, a lordship or barony held by a lord and subject to the jurisdiction of a court-baron held by him; in more ancient usage, an estate of a lord or thane with a village community, generally in serfdom, upon it. See *villainage* and *yard-land*.

In the iii. yer of his reign in Septembre was bore to the kyng a son cleped Richard, att Oxenford in his manoir, wher is now the white freces.

Rob. of Gloucester, p. 484, note.

These *manors* [those with which England was covered about the time of the Domesday Survey] were in fact in their simplest form estates of manorial lords, each with its village community in villenage upon it. The land of the lord's demesne — the home farm belonging to the manor-house — was cultivated chiefly by the services of the villata, i. e. of the village community or tenants in villenage. The land of this village community, i. e. the land in villenage, lay round the village in open fields. In the villages were the messuages, or homesteads of the tenants in villenage, and their holdings were composed of bundles of scattered strips in the open fields, with rights of pasture over the latter for their cattle after the crops were gathered, as well as on the green commons of the manor or township.

Schönbm, Eng. Vil. Community, p. 76.

On close inspection, all feudal society is seen to be a reproduction of a single typical form. This unit consists of a group of men settled on a definite space of land, and forming what we Englishmen call a *Manor*, and what in France was called a *Manoir*.

Maine, Early Law and Custom, p. 302.

The name *manor* is of Norman origin, but the estate to which it was given existed, in its essential character, long before the Conquest; it received a new name as the shire also did, but neither the one nor the other was created by this change.

**II. n. 1.** A book, paper, or instrument written by hand with ink or other pigment, or with a pencil or the like; a writing of any kind, as distinguished from anything that is printed. Especially—2. Such a book, paper, or instrument so written before the introduction and general adoption of printing in the fifteenth century, or in a style in vogue before the invention of printing. The oldest surviving manuscripts are Egyptian, of which some are at least 3,500 years old. Ancient manuscripts are written on papyrus, parchment, or vellum, and are usually in the form of a long band which was rolled for convenience about a rod. Greek manuscripts are in uncial, cursive, or minuscule characters. The uncials are the oldest form, and resemble modern capitals. The cursive characters are derived from the uncials, though they came to differ much from these in shape, and are used in manuscripts from the second century before Christ. The minuscule writing is that practised with few or no exceptions since the ninth century; the forms of the earliest printed Greek closely resemble it. Latin manuscripts are in capital, uncial, cursive, or minuscule characters. The capitals are the earliest form, but their use was not entirely discontinued until the Carolingian epoch. The uncials, of which the letters are characterized by their rounded shape, were developed very early, attained their highest perfection in the fourth century, and continued in use until the ninth century. The cursive writing was developed from the uncial; it appears in the graffiti found scratched on the walls of Pompeii, Rome, etc., and is the parent of many old systems of writing, as the Lombard and Merovingian. The minuscule style was developed in the eighth century, in the monastery of St. Martin at Tours, and reached its perfection in the twelfth century. In this style are written the splendid manuscripts of the middle ages, produced for the most part in monasteries, and enriched with superbly illuminated initial letters and elaborately painted miniatures. Upon the introduction of printing, the minuscule writing supplied models to the earliest type-makers. *Palmiest manuscripts* are manuscripts written in antiquity or in the early middle ages upon papyrus or vellum from which earlier writing had been erased. Modern science has been successful in deciphering the imperfectly effaced characters of many such manuscripts, and has recovered in this way some of our most valuable remnants of classic literature. The three most important Biblical manuscripts extant are the Alexandrian Codex, the Vatican Codex, and the Sinaitic Codex. (*See codex*.) These are of course all uncials. *See capital, cursive, majuscule, minuscule, uncial*. Often abbreviated *MSS.*, plural *MSS.*

The L. *mappa* became corrupted in ML. to *mapa*, > ult. E. *napery*, *napkin*, and *napron*, *apron*, q. v.] 1. A drawing upon a plane surface representing a part or the whole of the earth's surface or of the heavens, every point of the drawing corresponding to some geographical or celestial position, according to some law, of perspective, etc., which is called the *projection*, or, better, the *map-projection*. See *projection*. A map of the earth, or of a part of the earth, frequently exhibits merely the positions of countries, mountains, rivers, lakes, cities, etc., relatively to one another, and by means of lines of latitude and longitude, relatively to every other point on the earth's surface. Maps may be so colored or shaded as to give a variety of information; for example, to indicate the geological structure, the amount of rainfall, the principal productions, or the languages spoken. There are thus geological, meteorological, linguistic, faunal, and other kinds of maps. In maps on a large scale, or those which are the

result of careful topographical surveys, the relief of the surface is generally indicated with more or less accuracy. This is done either by contour-lines or hachures, or by simple shading. By the latter method, as ordinarily practised, the indications of the relief of the surface are but rough in character. With sufficiently accurate data and a careful and artistic treatment, a close approach may, however, in this way be made to the effect obtained by photographing a model of the surface in question in an oblique light. From such a photograph the eye gets at once a very clear idea of the character of the surface.

It is distinguished by the one-celled ovary, the slender branched inflorescence, and the narrow involute bracts, closely surrounding the branches. They are herbaceous plants with fleshy tubers, sheathing leaves, and a few-flowered inflorescence, the flowers having a cylindrical corolla-tube, and a petaloid filament bearing a one-celled anther. There are about 15 species, indigenous to tropical America, but several species are widely cultivated for their fleshy tubers. Limestone in a more or less crystalline or crystalline-granular condition. Any limestone, however, even if very compact or showing only traces of a crystalline structure, may be called *marble* if it is capable of taking a polish, or if it is suitable or desirable for ornamental and decorative purposes. The presence of magnesium carbonate associated with the calcium carbonate, forming dolomitic limestone or even pure dolomite, does not in any way influence the nomenclature of the rock; indeed, such presence cannot usually be known except from chemical analysis. Marble is a material of great importance in architecture, not only for exterior use, but for interior decoration in large, costly monumental structures. Thirty-three varieties of ornamental stone are used in the interior of the Grand Opera House in Paris and a large proportion of these may be classed as marbles. The value and beauty of marble depend largely on its coloration. Perfectly pure carbonate of lime, dolomitic limestone, and dolomite are all colorless, and white marbles—or at least such as are only slightly tinged with color—are very abundant. White marble such as is used for statuary (for which purpose it must be obtained in large blocks free from flaws or defects of any kind, and perfectly uniform in tint) is extremely rare. Among the finest statuary-marbles are those used in the masterpieces of Greek sculpture, of which that from the island of Paros is generally admitted to surpass all others, especially in the possession of a certain amount of translucence by which the artistic effect of the work is heightened. The Parian quarries seem, however, to have been practically exhausted. The Pentelicon marble, obtained from quarries near Athens, stood next to the Parian in ancient times, and its quarries are still apparently inexhaustible. At the present time the artistic world is supplied with statuary-marble from quarries in the Apennine mountains overlooking the Bay of Spezia, and in the vicinity of Carrara, Massa, and Serravezza. From this marble were carved the finest works of Michelangelo. These quarries, which have been extensively worked for 2,000 years, furnish, in addition to the white, a large amount of variegated marble, especially of the variety known as *bariglio*. The number and variety of colored and variegated marbles used for various artistic and architectural purposes is very great. Entirely black marble capable of taking a fine polish is rare; much more common are varieties irregularly shaded with gray, bluish-gray, or dove-colored tints. Bright colors—red, yellow, green, and blue—are much rarer than the less brilliant shades, but they are seen in some marbles, and are occasionally so blended and interblended as to produce extremely beautiful effects. These brilliant colorations are chiefly due to the presence of iron in various combinations; dark and grayish shades are generally caused by the presence of a greater or less amount of organic matter. In many varieties of marble the presence of organic remains embedded in the rock adds greatly to its attractiveness. Joints and stems of encrinurus, as well as many other kinds of fossils, occur in this way, and by contrast of their color with that of the material in which they are inclosed, as well as by the gracefulness of their forms, produce a very fine effect. Fragments of shells embedded in calcareous rocks sometimes exhibit a brilliant display of iridescent coloration; such marbles are known as *lumachelles*, or, sometimes, *fire-marbles*. A beautiful effect is occasionally produced as the result of deposition of the calcareous material in stigmatic form, so that when cut and polished the marble exhibits concentric zones of various tints; varieties having this structure are frequently called *onyx marble*. The vicinity of the Mediterranean is the classic region of marbles. Italy, France, and Spain are rich in beautiful varieties, and these are seen in the greatest number and to the best advantage in the architectural works of ancient and modern Rome. For this reason many of the rarest and most attractive marbles are best known by Italian names, and these names are frequently applied to varieties occurring far away from the Mediterranean, from either real or fancied similarity to the Italian marbles. Some of the best-known and most highly prized classic variegated marbles are the following. *Africam*, from the island of Chios, is a lumachelle, or shell-marble, exhibiting a great variety and brilliancy of coloration, reddish and purplish tints predominating. *Bardiglio* is common in the Apennine quarries, of a grayish- or bluish-white color, traversed by darker veins of the same. *Brecciated* and *brecciatello* are extremely variegated marbles, with numerous interlacing veins of yellow, violet, and crimson tints, on a yellowish ground; marble bearing these designations has been and still is quarried in various places, and especially near Tortosa in Spain. *Cipollino* is a marble with more or less of a concretionary structure, of many tints and much variety in their arrangement, with corresponding names such as *cipollino verde*, *marbizzato* (having almond-shaped patches of color, *rosso*, etc.), an example of this marble may be seen in the columns of the Fraccio Nuovo of the Vatican. *Florio di persico* is an exquisitely beautiful marble, with a reddish and crimson shading on a white base; called by the ancients *marmor Melios inn*, because coming from the region inhabited by the Melossi, in what is now Albania on the eastern coast of the Adriatic. *Giulio antico* or *Numidian marble* is an

Shell-marble.

extremely beautiful marble quarried in northern Africa; it was highly esteemed and extensively used by the Romans. The tints are variable, red and yellow predominating; the different varieties were designated by names indicating the prevailing tints. *Giulio di Siena* is a beautiful yellow marble of various depths of color, with darker veins, in which violet lines predominate; when these veins are very numerous the marble becomes a *brecciated*. *Pavonazzo* and *pavonazzetto* are various red and purplish marbles and breccias, some of the latter being also true marbles, but having a more or less brecciated character. The most beautiful pavonazzetto is that called by the Romans *marmor Syndicum* or *Phrygian marble*, from the locality where it was obtained; it is characterized by a very irregular venation of dark-red with bluish and yellowish tints, ramifying through a translucent alabaster-like base, which is sometimes almost opaline in its play of colors. *Rosso antico* is a marble of very deep red color, sometimes of various shades, occasionally streaked or clouded with dark-purple or whitish tints. The original locality of the classic rosso antico has not been discovered, but some modern red marbles closely resemble this variety. Some of the most highly prized French colored marbles bear names peculiar to France. (See *griotte*, *porfir*, *sarracénin*.) The Devonian and Carboniferous of England and Ireland furnish a considerable number of ornamental marbles. Devonshire and Derbyshire are the counties in which the best-known English varieties are obtained. The finest Irish variegated marbles are quarried near Armagh, and at various localities in county Cork, also at Killarney, and on the islands of the Kenmare river; and marble called *Siena* is obtained from several places in King's county and near Shannon Harbor in Galway. The most important quarries of white and grayish marble in the United States are those in the Lower Silurian of Vermont and western Massachusetts. There are very extensive marble-works at Rutland in Vermont, at Lee in Massachusetts, and at many other points in the same geological formation. Some of the variegated marbles found on the islands and near the shores of Lake Champlain are very handsome, but they are not extensively worked. The most popular colored marble in the United States at the present time is the Tennessee, a light-grayish stone beautifully mottled with shades of pinkish red. This marble has been extensively employed in the capitols at Washington and Albany.

A piece of sculptured or inscribed marble, especially if having some interest as an object of study or curiosity, and more particularly if ancient; any work of art in marble; as, the *Elgin marbles*.—3. A little ball of marble or other stone, or of baked clay, porcelain, or glass, used by children in play; an alley.—4. The most valuable object in this collection is the inscribed slab called the Parian Chronicle, from having been kept in the island of Paros. In its perfect state, the inscription contained a chronicle of the principal events in Grecian history from the time of the mythical Cerope to the archbishop of Diogenes (264 B. C.); but the part of it covering the last ninety years is now lost, and much of what remains is corroded and defaced.—*Elgin marbles*, a collection of ancient sculptures, for the most part of the school of Phidias and from the Parthenon at Athens, taken to England during the first years of the nineteenth century by the Earl of Elgin, and now preserved in the British Museum.

seum. These sculptures are the finest surviving work of ancient artists, and comprise the greatest part now in existence of the sculptured decoration of the Parthenon, including the splendid fragments of the pediment statues, a great number of metopes, and an extended series of the blocks carved in low relief of the cella frieze. The removal of the marbles, many of which were torn violently from their original positions upon the Parthenon, to the further damage of that monument, was in itself an act of vandalism; but their transportation to England at a time when Greece was accessible with difficulty opened the

eyes of the world to the preeminence of Greek work. It was one of the first steps toward securing an accurate knowledge of Hellenic ideals, and has thus influenced contemporary civilization. **Entrochial marble.** See *entrochial*. **Hymettian marble.** See *Hymettian*. **Kilkenny marble,** a variety of the black marble containing shells, much used for mantelpieces. **Ligneous marble.** See *ligneous*. **Madrepore marble.** See *madrepore*. **Marazzo marble,** an imitation of marble and other fine veined stones in solid slabs, the base of which is cement. **Pergamene marbles, or Pergamum marbles,** two series of sculptures in high relief and of an original type of Greek art, forming part of the decoration of the great altar of Zeus and Athena, erected at Pergamum by King Eumenes II. (197-159 B.C.) in commemoration of splendid victories over the invading Gauls. Abundant remains of these sculptures have been unearthed since 1875 by Karl Humann, and are now in the Berlin Museum. See *Pergamene art*, under *Pergamene*. **Petworth marble,** also called *Sussex marble* (both names arising from its being worked at Petworth in Sussex), a variously colored limestone occurring in the Weald clay, containing the remains of fresh-water shells.

The crystallized varieties take various imitative forms called *cockscomb pyrites*, *spear pyrites*, etc.; the massive kinds are often radiated, concretionary, etc. Marcasite is much more liable to alteration than ordinary pyrite, passing by oxidation into iron sulphate or copperas. Marcion taught that there were three primal forces: the good God, first revealed by Jesus Christ; the evil matter, ruled by the devil; and the Demiurge, the finite and imperfect God of the Jews. He rejected the Old Testament, denied the incarnation and resurrection, and admitted only a gospel akin to or altered from that of St. Luke and ten of St. Paul's epistles as inspired and authoritative; he repeated baptism thrice, excluded wine from the eucharist, inculcated an extreme asceticism, and allowed women to minister. A bordering or bounding space; a border; a space between one edge or line and another, as that along a river between the edge of the water or of its bed and a real or imaginary outer line, or the like, or that between the edges of a leaf or sheet of paper and those of the printing or writing on it. In some plants the leaf (then called *marginiate*) has a distinct margin or border of different formation or coloration from the main body. In the case of a book, *margin* alone usually means the clear space between the print and the outer edge of the leaf, called distinctively the *front margin*; the head or top margin is at the top of the page, the tail or bottom margin at the foot, and the *back margin* on the inner side against the back. Parts of these margins, especially at the sides, may be occupied by marginal notes, remarks, or the like. An *opened margin* is one where the leaves have been opened or separated, as with a folder, but not trimmed; an *uncut margin* has not been cut anywhere; a *rough-cut margin* has only the more protruding ragged edges cut off with scissors; in a *cropped margin* too much paper has been cut away; in a *bled margin* part of the print has been cut away.

We came into the road, where I saw an antient way  
about eighteen feet broad, paved with large round stones,

*Pope*, *Iliad*, xviii, 641.

Along the *margin* of the river.  
*Whittier*, *Mogg Megone*, ii.

Specifically—(*a*) In an engraving, the paper left blank outside the plate-mark. (*b*) In *entom.*, properly, the outer part of a surface or distinct portion of the integument, as distinguished from the central part or disk. In this sense *margin* is not to be confounded with *edge*, which is used to denote the extreme boundary of a part; but where distinction is unnecessary, the two terms are often used synonymously. (*c*) In *conch.*, the edge or entire outline of a bivalve shell. (*d*) In *bot.*: (1) The edge. (2) A distinct border, different from the body of the organ, as the membranous expansion surrounding some seeds or seed-vessels; a narrow wing.

2. In *joinery*, the flat part of the stiles and rails of framed work. Doors which are made in two widths

3. Latitude, scope, or range; freedom from narrow restriction or limitation; room or provision for enlarged or extended action.

Their *margin* of effective operation is strictly limited; still, such a *margin* exists, and they [trades-unions] have turned it to account. *Kae*, Contemporary Socialism, viii.

4. Allowance made, security given, or scope afforded for contingencies, as profit or loss in trade, error of calculation, change of circumstances, diversity of judgment or opinion, etc.

There is always *margin* enough in the statute for a liberal judge to read one way and a servile judge another. *Emerson*, Fugitive Slave Law.

5. In speculative dealings on the exchanges: (a) The sum in money, or represented by securities, deposited by a speculator or trader with his broker as a provision against loss on transactions made on account. This margin is usually reckoned at 10 per cent. of the par value of stocks or bonds, and 10 cents per bushel or barrel on grain or oil. If the price rises or falls to a satisfactory extent, a sale or purchase is made, and the gain is the customer's profit, less the broker's charges; if the price falls below or rises above the margin furnished, and the purchase is to be protected in expectation of a future rise or fall, the customer is required to furnish ("put up") more margin to cover the difference.

The banks refused to loan upon any except first-class collateral, and commission-houses regarded the market as in a somewhat dangerous condition for speculators on *margin*. *Appleton's Ann. Cyc.*, 1886, p. 342.

(b) A deposit made by each of two brokers, parties to a contract, when one is "called up" (as it is termed) by the other. A visible impression made by some material object upon another; a line, dot, dent, cut, stamp, bruise, scar, spot, stain, etc., consisting either of the visible effect produced by the impressing object or the transfer of a part of its substance. A mark in this general sense is understood to be an incidental or a casual effect, without significance except with reference to means or results.*

Specifically—2. An impressed or attached sign, stamp, label, or ticket; a significant or distinguishing symbol or device; that which is impressed or stamped upon or fixed to something for information, identification, or verification: as, a manufacturer's *marks* on his wares (see *trade-mark*); the *mark* made by an illiterate person opposite or between the parts of his name when written by another on his behalf; a merchant's private *marks* on his goods, to indicate their price or other particulars to his assistants; a *mark* branded on an animal by its owner; to give a student so many *marks* for proficiency. See *hall-mark*. In etymology the mark is a cipher, word, or other device put upon a piece of ware, usually on the bottom or the under side, as an indication of the pottery from which it comes, a signature of the painter who decorated it, or the like. Such marks are often impressed in the clay before the glaze is applied and often painted under the glaze, or otherwise permanently adixed. Very rarely they form a part of the decoration, as the Chinese characters painted in gold or red on the Japanese ware known as kaga or kuiton. On a nautical lead line a mark is one of the measured indications of depth, consisting of a white, blue, or red bag, a bit of leather, or a knot of small line.

3. A distinguishing physical peculiarity: a spot, mole, nevus, special formation, or other singularity; a natural sign: as, a birth-*mark*; the *marks* on sea-shells or wild animals. In farriery the *mark* is a deep median depression on the cutting surface of the incisor tooth of a horse, due to the inflection of a vertical fold of the tooth. It is seen of different characters according to the wear of the tooth, being thus to some extent an index of a horse's age. It disappears after the tooth is worn down beyond the extent of the fold. The dark color is due simply to the accumulation in the fold of food or dirt. See the quotation under *mark-tooth*.

4. A significant note, character, sign, token, or indication; a determinative attestation. In logic, to say that a thing has a certain *mark* is to say that something in particular is true of it. Thus, according to a certain school of metaphysicians, "incognizability is a *mark* of the Infinite."

A unit of weight used in England before the Conquest, and in nearly all the countries of Europe down to the introduction of the metric system, especially for gold and silver. It was generally equal to 8 ounces. In 1524 the Cologne mark was made the standard for gold and silver throughout the German Roman empire, and copies were distributed to all the principal cities. But, owing to the carelessness with which these were made, preserved, and copied, the Cologne mark came to have different values in different places. The following table shows the values of some of the principal marks in English troy grains, either directly as given, or reduced from French grains, doli, or milligrams. The larger discrepancies are in most cases due to known changes of standards.

The word *marl*, however, is used so vaguely as to be often ambiguous; and in England some substances are thus designated in which there is no lime. Marl is a valuable fertilizing material for different kinds of soil, according to its composition. In New Jersey the mixtures of greensand with clay much used as fertilizers are commonly called *marls*, or *greensand marls*, and many varieties thus designated contain no more than one or two per cent. of carbonate of lime. Marls and marly soils are especially well developed in the Permian and Triassic of England and on the continent. The upper division of the Keuper in England is known as the "Red Marl Series," and in places reaches a thickness of 3,000 feet. These marls are largely quarried at various points for making bricks. parts of Europe, especially in Russia. North America has at least three species: the common woodchuck or ground-hog, *A. marmota*, found abundantly in many parts of the United States and Canada; the yellow-bellied marmot of the Rocky Mountains, *A. flaviventris*; and the large hoary marmot or whistler of northwestern America, *A. pringi*. **Maronite** (mar'ō-nīt), *n.* [= *F. Maronite*; as *Maron* (see def.) + *-ite*.] One of a body of Syrian Christians dwelling chiefly in the mountains of Lebanon and Anti-Lebanon. They are named from St. Maron, a Syrian monk (about A. D. 400), or less probably from John Maron, patriarch of the sect in the seventh century. The Maronites were originally Monothelites, but they entered into a partial union with the Roman Catholic Church in 1182, which after an interruption was made closer in 1445 and again in 1596. They still retain their own patriarchate of Antioch (now seated at Ka-nobin), their Syrian liturgy (although Arabic is now their vernacular tongue), the marriage of priests, their traditional fast-days, and the use of both elements in lay communion. The Maronites as a tribe were formerly under the same local government as the Druses, with whom they have had some bloody conflicts. In 1861, after a severe outbreak, they were put under a separate governor.

The United States declined to accede to this agreement, but proposed that all innocent private property at sea be exempt from seizure by public armed vessels in time of war.

A marquis was originally an officer charged with the government of a march or frontier territory; the title as an honorary dignity was first bestowed in England in 1386. (and F.) mariage = Pr. maridatge, maridage = Sp. maridaje = It. maridaggio, < ML. maridatium, marriage, < maritus, a husband, marta, a wife; see marital, marry*.] 1. The legal union of a man with a woman for life; the state or condition of being married; the legal relation of spouses to each other; wedlock. In this sense marriage is a status or condition which, though originating in a contract, is not capable of being terminated by the parties' rescission of the contract, because the interests of the state and of children require the abiding of certain permanent duties and obligations upon the parties.

2. The formal declaration or contract by which act a man and a woman join in wedlock. In this sense marriage is a civil contract, implying the free and intelligent mutual consent of competent persons to take each other, as a present act, as husband and wife, and according to the modern and most prevalent view no formalities other than such as the law of the jurisdiction may expressly impose are necessary to prevent either from subsequently repudiating the other or denying the legitimacy of their issue. The formalities provided for by the law of some of the United States are optional, being intended chiefly to enable the parties to preserve authentic evidence of the contract. When a man and a woman live and cohabit together, and conduct themselves as man and wife in the society and neighborhood of which they are members, till the belief and reputation that they are married become general, their marriage is presumed, without other evidence, for purposes of enforcing rights and liabilities of third persons.

Marry, Wed, Marry, Vow, Matrimony, Wedlock**. *Marriage* is the act of forming of entering into the union of the individual. *Wedlock* normally includes the ceremonies and festivities attending the celebration of the union of marriage, but not essential to it. *Matrimony* is often made without such ceremonies. *Widowhood* is more formal than *wedding*. We speak of the *nuptials* of a prince. *Matrimony* is the married state, or the state into which a couple are brought by marriage. *Wedlock* is the vernacular English word for *matrimony*, not differing from it in meaning, but being the ordinary term in law. — *as, born in wedlock*.

**Mars** (märz), *n.* [L. *Mars* (*Mart-*), OL. *Mavros* (*Mavort-*); also *Marmar*, Oscan *Mamers* (*Mamert-*), Mars.] 1. A Latin deity, identified at an early period by the Romans with the Greek Ares, with whom he had originally no connection. He was principally worshipped as the god of war, and as such bore the epithet *Gradivus*; but he was earlier regarded as a patron of agriculture, which procured him the title of *Silvanus*, and as the protector of the Roman state, in virtue of which he was called *Quirinus*. In works of art Mars is generally represented as of a youthful but powerful figure, armed with the helmet, shield, and spear; in other examples he is bearded and heavily armed. See cut under *Ares*.

The mailed *Mars* shall on his altar sit  
Up to the ears in blood.

*Shak., 1 Hen. IV., iv. 1. 117.*

2. The planet next outside the earth in the solar system. Its diameter (about 4,200 miles) is only 0.53 that of the earth, its superficies 0.28, and its volume 0.147. Its mean density is 0.71 that of the earth, so that the density of its crust may very likely be about the same as the earth's; but the weight of a given mass at the surface of Mars is only three eighths of the weight of the same mass on the earth. The strength of materials is therefore relatively much greater there, and mountains, animals, and buildings would naturally be much larger. The mean distance from the sun is 141,500,000 miles. The eccentricity of its orbit is very much greater than that of the earth, being 0.093 in place of 0.017; the inclination of its equator to its orbit is about the same. Its day is half an hour longer than ours. Its year is 687 of our days. The surface of Mars has been carefully mapped, and is characterized by the predominance of land and the great number of canals or straits. Its color is strikingly red. Its climate is, perhaps, not very different from that of the earth. It has two moons, discovered by Professor Asaph Hall in Washington in 1877, conformably to the prediction of Kepler, and realizing the fancies of Swift and of Voltaire. The inner of these, Phobos, revolves in less than 8 hours, so that to an observer on the planet it rises in the west and sets in the east; the outer, Deimos, revolves in 30 hours, so that it appears nearly stationary for a long time. The symbol of Mars is ♂, which seems to show the shield and spear of the god.

They have discovered two lesser stars, or satellites,  
which revolve about *Mars*, whereof the innermost . . .  
revolves in the space of ten hours, and the outermost in  
twenty-one and a half. *Swift, Gulliver's Travels, III. iii.*

age of the marshes it colonizes. It lays from 6 to 10 eggs of chocolate-brown color, but many of the nests never have eggs in them, being apparently built and used by the males alone. A variety of this species found in California is known as the *tidal wren*. The short-billed marsh-wren, *C. stellaris*, is quite different, being almost entirely streaked above with black and white, besides the distinction implied in the name. It nests differently, lays white eggs, is less abundant, and is chiefly observed in the United States east of the Mississippi. Other kinds of marsh-wrens, mostly like the short-billed, inhabit Mexico, Central and South America, and the West Indies, but none of this genus are found in the Old World.

A digitigrade carnivorous quadruped of the family *Mustelidae*, subfamily *Mustelina*, and genus *Mustela* or *Martes*, of which there are several species, all inhabiting the northern hemisphere. This animal is about 18 inches long, with a full bushy tail 12 inches long, and thus rather larger than a house-cat, but standing much lower, on account of the shortness of the legs. The fur, consisting of three kinds of hairs, is full and soft, and of an extremely variable shade of brown, usually paler on the head and under parts. A closely related species is the stone- or beech-marten, *Mustela foina*, of Great Britain and many other parts of Europe; it is, on the average, smaller in size, with a whitish throat and inferior pelage. The American pine-marten, *M. americana*, is similar, but speciedly distinct; it inhabits the north

A cover for the face with apertures for seeing and breathing; especially, such a cover, usually of silk or velvet, as worn at masquerades; a false face; a vizor. Ancient Greek and Roman actors wore masks covering the head as well as the face, made to simulate the characters represented, with hair and beard when required, and with mouth-pieces so formed as to swell the volume of the voice; and masks of various forms have continued to be used in mummeries and pantomimes: for the latter (as also at masked balls), commonly covering only the upper part of the face to the tip of the nose or the upper lip. Masks are often used for disguise, as during the commission of nefarious acts, and under the name of *false faces*, usually grotesque or hideous, as toys for children; also sometimes by women to preserve the complexion, or as vehicles for the application of cosmetics. Masks of wire, gauze, etc., are used to afford protection to the face, as from splinters, dust, or smoke in glass-works, grinding-mills, and other factories, and also by fencers, firemen, and base-ball catchers.

 'Twould make a very pretty dancing Suit in a *Mask*.  
*Steele*, Tender Husband, iii. 1.  
 3. A form of histrionic spectacle, much in vogue during the sixteenth and seventeenth centuries. It probably originated in the practice of introducing on solemn or festive occasions men wearing masks to represent mythical or allegorical characters. From a mere acted pageant, it gradually developed into a complete dramatic entertainment, in which the scenes were accompanied and embellished by music, and, in the hands of writers like Ben Jonson, Beaumont and Fletcher, and Milton, reached a high degree of literary excellence.

Hence, though these larvae are exceedingly voracious, they appear at first sight quite harmless. Also called *forcipate labium*.

There is a twofold Masora, a Babylonian or Eastern, and a Palestinian or Western, the former being the more important. The Masora not only takes account of various readings, but also contains notes of a grammatical and lexicographical character, including the system of Hebrew vowel-points first established by it. With much that is valueless, it contains all the material from which a critical revision of the Old Testament text can now be derived. Also written *Masorah* and *Massora*.

**mass<sup>1</sup>** (mās), *n.* [*From ME. *masse*, *messe*, < AS. *masse*, the mass, a church festival, = OS. *missa* = OFries. *missa* = MD. *missa*, D. *mis* = MHG. *misse* = OHG. *missa*, *missa*, MHG. *messe*, *misse*,*

The name *missa* is usually said to be taken from the words *ite, missa est*, 'go, it is the dismissal,' or 'go, dismissed' (the word *cancro*, 'congregation,' being unnecessarily supposed to be omitted), thought to have been used at that point of the mass when the catechumens were dismissed, and the communion service followed; but it appears to have referred orig. to the dismissal of the congregation at the end of the mass, and to have been applied, by an easy transfer, to the service itself.] 1. The celebration of the Lord's Supper or eucharist.*

That office which was called the *Mass* by the mediæval and the Latin Church, but which we now call the Lord's Supper and the Holy Communion.

*Procter, Hist. Book of Com. Prayer*, p. 305. The Supper of the Lord, and the Holy Communion, commonly called the *Mass*. *Book of Common Prayer* (1549).

2. The office for the celebration of the eucharist: the liturgy. The component parts of the mass or liturgy are the *ordinary of the mass* (*ordo missæ*) and the *canon of the mass* (*canon missæ*), succeeded by the communion (sometimes counted part of the canon) and post-communion. Anciently and technically the part preceding the offertory is the *mass* or *liturgy of the catechumens* (*missa catechumenorum*), the remainder the *mass* or *liturgy of the faithful* (*missa fidelium*). In the Roman Catholic Church different classes of masses are *high mass*, *low mass*, *private mass*, *votive mass*, etc. See the phrases below.

It needst not to speke of the *messe* ne the seruise that thei hadde that day, for it were but losse of tyme.

*Melville (E. E. T. S.)*, ii, 375.

And when our parish-masse was done, Our kinge was bowne to dyne.

*Sir Cauline (Child's Ballads, III, 175).*

The time of the Communion shall be immediately after that the Priest himself hath received the Sacrament, without the varying of any other rite or ceremony in the *Mass*.

*Order of the Communion* (1548).

The maiden buried, not as one unknown, Nor meantly, but with gorgeous obsequies, And *mass*, and rolling music, like a queen.

*Tennyson, Lancelot and Elaine.*

3. The sacrament of the eucharist or holy communion. The word *mass* in this and the preceding senses is popularly used of the eucharist as celebrated in the Roman Catholic Church, or of the teachings of that church with regard to the sacrament, as involving not only the doctrines of the real presence and the eucharistic sacrifice, held in some other churches also, but the doctrine of transubstantiation as defined by the Council of Trent.

The use of the word *mass* (*missa*) in the Western Church is as old as the fourth century. The Greek Church has no term precisely corresponding to *mass*, the sacrament being generally called the *eucharist* or *holy communion*, and the office the *liturgy*. At the Reformation the first Prayer-Book (1549) of the Church of England retained the name *mass*, which was omitted in the second book (1552) and fell into disuse, being popularly regarded as involving a Roman Catholic view of the sacrament. The use of the word has, however, been revived to some extent among Anglicans in the present century. Swedish and Danish Protestants use the corresponding word for their own communion office.

4. A musical setting of certain parts of the Roman Catholic liturgy, also of corresponding parts of the Anglican liturgy. It consists usually of the following sections, each of which is sometimes divided into separate movements: Kyrie, Gloria (including the *Gratias agimus, Qui tollis, Quoniam, Cum Sancto Spiritu, Credo* (including the *Et incarnatus, Crucifixus, Et Resurrexit*), *Sanctus* (including the *Hosanna*), *Benedictus* (including a repetition of the *Hosanna*), and the *Agnus Dei* (including the *Dona nobis*). To these an Offertorium (after the *Credo* and before the *Sanctus*) is sometimes added. The Requiem Mass differs largely from the regular mass, and includes settings of several of the stanzas of the hymn "Dies Irae." The artistic form of musical masses varies widely, from unaccompanied plain-song to the most elaborate polyphony with orchestral accompaniments. Mediæval masses were named usually from the melody which was taken as the subject for contrapuntal treatment, as Josquin's mass "L'homme armé"; modern masses are named from the key of the first movement, as Bach's "Mass in B minor."

5. A church festival or feast-day: now only in composition: as, *Candlemas, Childermas, Christmas, Lammas, Martinmas, Marymas, Michaelmas, Roodmas* (compare *kermess*).—By the *mass*, an oath formerly in common use: sometimes abbreviated to *mass*.

The same name was also given to an office consisting of part of the

ordinary of the mass, and without either consecration, elevation, or communion: said in some places in the middle ages for strangers who came too late for the celebration. The Typics of the Greek Church have been compared to such an office. What is commonly known as the *Auto-communion Service* has sometimes been called by Anglican writers the *Dry Service* (*Missæ siccæ*).—**High mass**, a mass accompanied by music and incense, celebrated on Sundays, feast-days, and other special occasions by a priest or prelate, attended by a deacon and subdeacon.—**Low mass**, the ordinary mass, said, not sung, by the priest.—**Mass bell**. Same as *Liturgy of the Presanctified*. See *liturgy*.—**Ordinary of the mass**. See *ordinary*.—**Private mass**. (a) *Low mass*. (b) Any mass where only the priest communicates, especially such a mass celebrated in a private oratory.—**Votive mass**, a mass which does not correspond with the office of the day, but is said at the choice of the priest.

*Shak., Hamlet*, iv, 4, 47.

5. The quantity of any portion of matter as expressed in pounds or grams, and measured on an ordinary balance with the proper reduction for the buoyancy of the atmosphere; otherwise, the relative inertia, or power in reaction, of a body. For example, if two bodies at rest, but free to move, as a gun suspended in vacuo and a bullet in it, are suddenly separated by a force acting between them, their respective velocities will be inversely as their *masses*, and this phenomenon best defines *mass*. It is usually confounded with weight, which is more properly the force with which a body is accelerated in the direction in which a plummet points, in consequence of the earth's attraction and rotation. Thus, if a piece of lead which is found to weigh a pound at the base of the Washington monument is transported to the top, it will be found to weigh a pound there, for its *mass* is unchanged. But if only the piece of lead and the balance are carried to the top of the monument, while the weight against which it has been weighed is left at the base, and there attached to the balance at the top by means of a long string or wire (the weight of which is to be properly allowed for), the piece of lead would be found to have lost the weight of one third of a grain, the weight thus varying though the *mass* does not.

The destructive effects of a cannon-ball are due entirely to its *mass* and to the relative speed with which it impinges on the target, and would be exactly the same (for the same relative speed) in regions so far from the earth or other attracting body that the ball had practically no weight at all. . . . When we open a large iron grate properly hinged it is the *mass* with which we have to deal; if it were lying on the ground and we tried to lift it, we should have to deal mainly with its weight.

*Tait, Properties of Matter*.

The means employed are rubbing, kneading, and light pounding, combined ordinarily with more or less additional stimulation of the skin, as by friction and slapping. This manipulation furthers the removal of lymph from the parts, which is especially needful when the lymphatic flow is sluggish through lack

of muscular exercise; it apparently quickens the blood-circulation through the part, and furnishes gentle vibration under exercise; it acts possibly as a direct trophic stimulus to muscular and sustentacular tissues, by stretching ligamentous structures it maintains or increases suppleness; in the abdomen it stimulates and aids peristalsis; and as a general stimulation of sensory nerves it may affect favorably the nutrition of the central nervous system. It is represented in the customs of many primitive peoples, and in a developed form constitutes a valuable resource of modern scientific therapeutics.

This oxide, separated from the grains of lead by sifting, and exposed to a heat sufficient to make it red-hot, but not to melt it, assumes a deep yellow color. In this state it is called *massicot*, but does not differ chemically from litharge, though different in color and mechanical condition. After melting it has a reddish tint, and is called *litharge*. Massicot, slowly heated by a moderate fire, is further oxidized to minimum or red lead. It is sometimes used as a pigment, and as a drier in the composition of ointments and plasters. **6.** In *philos.*, consisting in or pertaining to matter in the Aristotelian sense, and not to form; arising from matter of positive fact, and not from logical implication; referring to the object as it exists, and not to distinctions originating in the mind; relating to a word as an object, and

not to its meaning. All the *mat-ri-ál* is *mat-ri-ál* in the middle ages, and in them *mat-ri-ál* is *mat-ri-ál*. In late times and later writing, *mat-ri-ál* is *mat-ri-ál* pertaining to the outward world, as opposed to the inward. In the Kantian terminology, *mat-ri-ál* is *mat-ri-ál* derived from matter in the Kantian sense of that term, namely, that which is contributed to cognition by the senses. Examples of the many established phrases in which this word occurs are given below.

**7.** In the *law of evidence*, of legal significance in the cause; having such a relation to the question in controversy that it may or ought to have some influence on the determination of the cause. See *immaterial issue*, under *is*, *an*.

**Material cognition**, *see cognition*. **Material consequence**, a consequence, or premise with conclusion, which is valid, that is, of which the conclusion is true whenever the premise is true, but which is so by virtue of a matter of fact, and not by virtue of the logical forms of the premise and conclusion. The use of this term originated with Scotus, who further distinguishes between a necessary and a contingent material consequence, according as the premise needed to be supplied to render the consequence a logical syllogism is a necessary or a contingent proposition. **Material criterion of truth**, *see criterion*.

**Material descent**, the passage from a genus to a species which comes under it as a matter of fact, but not by logical necessity. **Material distinction**, the distinction between different individuals of the same species. This is an example of a use of the word *material* common with Thomas Aquinas and his followers, which seems to imply that matter is the principle of individuation. **Material fallacy**, a fallacy in which the syllogism satisfies all the rules of formal logic, but where the deception belongs to a class of falsifications of premises. Such, for example, are cases where "most" is exaggerated into "all," where we argue *post hoc ergo propter hoc*, etc. **Material form**, in metaph., a form depending upon matter, and having no independent existence, which is supposed to be true of every form except the human soul. **Material heresy**, *see heresy*, **2**. — **Material idea**, *see idea*. **Material knowledge**, same as *material cognition*. **Material logic**, *see logic*. **Material matter of a proposition**, the subject and predicate; opposed to the *formal matter*, which is the fact signified by the proposition. **Material mode**, a mode which affects the matter of a proposition; opposed to *formal mode*, which affects the form.

The material modes affect the matter of the enunciation, viz. either the subject or the predicate. For example, in this enunciation, A good shepherd lays down his life for his sheep, the word *bonus* or good is the mode of the subject. In this, A rhetorician speaks ornately and copiously, ornately and copiously are the modes of the predicate. *Burgschleier*, tr. by a Gentleman.

**Material multitude**, the plurality of a number in which the distinctions which may separate the objects are left out of view. Thus chemistry and mechanics have the same material object — that is to say, the whole universe.

**II.** *a. 1.* Component or contributory matter or substance; that of or with which any corporeal thing is or may be constituted, made, or done; as, the materials of the soil or of disintegrated rocks; wool is the material of cloth; building- or writing-materials; war-material.

Fiske, Evolutionist, p. 277.*

Ward, Encyc. Brit., XX. 56.*

Further, *ripe* always seems figurative when applied to anything besides fruit, especially fruit growing above ground; to speak of a *ripe* scholar, or a *ripened* judgment, is distinctly figurative. *Mature*, on the other hand, seems quite as literal now in the secondary as in the primary sense. The same distinction exists between the verbs and between the nouns corresponding to these adjectives.

At the restoration of Charles II. a May pole 134 feet high was set up in the Strand. A few May-poles still remain in England, although the celebration is almost obsolete.

Their chiefest jewel they bring from thence is the *May-pole*, which they bring home with great veneration, as thus . . . they have twentie or fourtie yoke of oxen, every one having a sweete nosegay of flowers tied to the tip of his hornes, and these oxen drawe home the *May-pole*. *Stubbes*, quoted in *Strutt's Sports and Pastimes*, p. 455.

**4.** Intermediate in a number of greater and less values, quantities, or amounts; forming an average between two or more terms of any kind; average: specifically, in *math.*, having a value which is a symmetrical function of other values of the same sort, such that, were all those other values to be equal, the value of the function would be equal to them all (compare **II. 4**): as, the *mean* breadth of a country; the *mean* distance of the earth from the sun.

The mean and true longitudes agree therefore at perihelion and aphelion. — **Mean moon,** an imaginary moon, supposed to move with an equable motion in the ecliptic, and in the same period as that which the real moon takes to perform a revolution with an unequal motion. — **Mean noon,** the moment when the mean sun passes the meridian. — **Mean place, in logic,** a place which partly agrees with the nature of the things to be proved, and partly differs from the same. The mean places are conjugates, cases, and divisions. — **Mean position, in fencing,** a position of the wrist midway between pronation and supination, with the thumb above the fingers. *Robinson (ed. *Cushman, quoted in Bradford's Plymouth Plantation, p. 55.*

**Mean sun,** in *astron.*, an imaginary or fictitious sun, moving uniformly in the celestial equator, and having its right ascension always equal to the sun's mean longitude. Its hour-angle at any moment defines the *mean time* or clock-time, just as the hour-angle of the actual sun defines the apparent or sun-dial time. The use of the mean sun in time-reckoning is necessitated by the fact that, owing to the eccentricity of the earth's orbit and the inclination of the equator to the ecliptic, the sun's real motion in right ascension is seriously variable, and the days, hours, etc., of apparent solar time have, therefore, no fixed length. See **day**, 3. — **Mean term, in logic,** same as *middle term* (which see under **middle**). — **Mean time,** a system of reckoning time, such that all the days and their like subdivisions are of equal length, its day being the mean interval between the two successive passages of the sun over the meridian of any place. The mean time at any moment may be defined as the hour-angle of the mean sun at that moment. (See **mean sun**.) Mean time is the time usually employed for civil and scientific purposes, and is the time indicated by an ordinary clock or watch, properly regulated. Apparent time is that indicated by a correctly adjusted sun-dial: the difference between the mean and the apparent time at any moment is called the *equation of time*, and sometimes slightly exceeds a quarter of an hour. — **Mean voice, in music,** a voice or voice-part intermediate between the highest and the lowest, as a tenor or an alto. — **Mean way,** mean-time.

(*c*) Either the second or the third string of a viol, the former being the *small mean*, and the latter the *great mean*. — **4.** A quantity having a value intermediate between the values of other quantities; specifically, in *math.*, the average, or *arithmetical mean*, obtained by adding several quantities together and dividing the sum by their number. In general a mean is a quantity which depends upon certain other quantities according to any law which conforms to these two conditions: first, that, if the quantities which determine the mean should all be equal, the mean would be equal to any one of them; and second, that no transposition of the values of the determining quantities among themselves can alter the value of the mean. (See *geometrical mean*, below.) The ancients recognized ten kinds of mean (*μεσότητες, mediastis*), distinguished by ordinal numbers, to which Jordanus Nemorinus added an eleventh. Only the first four, the arithmetical, geometrical, harmonical, and contraharmonical, are true means.

**5.** In *logic*, the middle term in a syllogism. — **64.** A mediator: an intermediary; an agent; a broker; a go-between.

= **Syn. 1.** *Mean, Medium, Average, Mediocrity.* *Mean* and *medium* represent the middle point or degree. *Mean* is much used in mathematics. (See *arithmetical mean, geometrical mean*, etc., above.) *Mean* is also much used in morals: as, in conduct we are to observe the golden *mean*; Aristotle held that each virtue was a *mean* between vice of defect and a vice of excess. *Medium* has this latter sense, but is used chiefly in matters of practical life: as, goods that are a *medium* between the best and the poorest; a color that is a *medium* between two others. In this sense *medium* is much used as an adjective: as, a *medium* grade, color, price. *Means* is the form of *mean* that corresponds to *medium* when it stands for that which, by being between others, is the agency for communication, etc. As *mean* and *medium* generally imply simply two extremes, but may imply several quantities of different amounts or degrees, so *average* may imply simply two extremes, but generally implies several quantities of different amounts or degrees: as, the *average* of 3, 5, 7, and 9 is 6. The latter word has similar figurative uses: as, the man's education was better than the *average*. *Mediocrity* is now used only in an unfavorable sense, implying blame or contempt: as, talents not above *mediocrity* — that is, very moderate. — **7.** Instrument, method, mode, way, expedient, resource, appliance.

The word *measles*, ME. *measles*, *measles*, is entirely distinct from ME. *mesel*, a leper, whence *meselry*, leprosy, but has been more or less confused with it; as in MD. *meisel-sucht*, MLG. *meisel*, *meisel-sucht*, *sukr*, defined as "the measles-sickness" (Hexan), or measles, but prop. the 'leper-sickness,' or leprosy. The words *mesel*, *meiselry* became nearly obsolete before the 17th century: in ME. the words were pronounced differently. Hence the equiv. *measlings*, q. v. The singular *measle* (def. 1, above) appears to have been developed from the plural (which is now used as singular), in the sense 'a spot like those of measles,' and not in the orig. lit. sense (in MD., etc.) of 'a little spot.'

1. A contagious disease of man, with an incubation period of about nine or ten days, and a period of invasion of about three or four days, in which there are pyrexia and rapid pulse, inflammation of the mucous membrane of the eyes and upper air-passages, and bronchitis, followed by an eruption of small rose-colored papule, which arrange themselves in curvilinear forms. The period of eruption usually lasts about four days. The eruption is succeeded by a bran-like desquamation. The poison is conveyed directly from the patient through the air and by fomites. It is given off in the period of invasion as well as in later periods. Also called *rubella* and *morbilli*.

6. A definite quantity measured off or meted  
out; as, a *measure* of wine or meal. In some  
places, as applied to certain things, a *measure* is a known  
quantity, the word being used specifically. Thus, in Eng-  
land a *measure* of corn is a Winchester bushel; in Con-  
necticut, a *measure* of oysters is five quarts.

as measured or meted out; the result of any  
mensural determination or rule; as, the *mea-  
sure* of or for the beams is 10 feet 4 inches;  
full or short *measure*. In many technical uses *mea-  
sure* has specific applications, according to the particular  
case involved. Thus, in printing, the *measure* of a line,  
page, or column is its width stated in ems.

Good *measure*, pressed down, and shaken together, and

11. In *pros.*: (a) Determination of rhythm by  
division into times or groups of times; rhythm,  
as so determined; meter. In ancient prosody  
the unit of measure is the primary time or  
mora. See *mora*. (b) A group of times or  
syllables used to determine the length of a  
colon, period, or meter. In ancient prosody the  
*measure* was sometimes a single foot (monopody), and some-  
times a pair of feet (dipody). Iambic, trochaic, and ana-  
apestic rhythms were as a rule measured by dipodies,  
other meters by monopodies. The *measure* was marked  
as such by beating time, the secondary ietus of a dipody  
not receiving the beat. According to the number of mea-  
sures contained in it, a meter was designated as *monome-  
ter*, *diometer*, *trimeter*, etc., and these terms are those still  
in use for modern poetry, some writers, however, counting  
every foot a *measure*.

Meeter and *measure* is all one, for what the Greeks  
call *μετρον*, the Latines call *Mensura*, and is but the quan-  
tity of a verse, either long or short.

(c) A rhythmical period or meter, especially  
as determined by division into such groups: a  
rhythm, line, or verse.

movement accords with a serious and elevated purpose.

*E. C. Steadman*, Viet. Poets, p. 93.

12. In *music*: (a) One of the groups of tones  
or of accents included between any two pri-  
mary or heavy accents or beats. A *measure* al-  
ways begins with such a primary accent, and includes one  
or two (or even more) secondary accents, with various pos-  
sible lesser accents. Most rhythms may be reduced to  
*measures* having either one primary and one secondary  
accent or one primary and two secondary accents, the for-  
mer rhythm being called *dyad* and the latter *triple*. *Mea-  
sures* are indicated in printed music by bars, one of which  
is placed before each primary accent. All the notes be-  
tween two bars are said to belong to the same *measure* or  
bar. The essential structure of the *measures* in a given  
piece of music is indicated at the beginning by the rhyth-  
mical signature. See *signature*. (b) Same as *tempo*.

[Rare.]—13. Any regulated or graceful mo-  
tion; especially, motion adjusted to musical  
time.

ment.

*measure*, and a cinque paces: the first step is hot and hasty,  
like a Scotch jig, and full as fantastical: the wedding,  
manly-modest, as a *measure*, full of state and an-  
ciency.

*Shak.*, Much Ado, ii. 1. 77.

15. A determinate action or procedure, intend-  
ed as means to an end; anything devised or done  
with a view to the accomplishment of a purpose;  
specifically, in later use, any course of action  
proposed or adopted by a government, or a bill  
introduced into a legislature; as, *measures* (that  
is, a bill or bills) for the relief of the poor; a  
wise *measure*; rash *measures*.

T. Hughes, Tom Brown at Rugby, II, 3.

*Beyond measure* I persecuted the church of God.

Gal. i. 13.

**Absolute measure.** See *absolute*. **Angular measure**, the system of units employed for measuring angles. It is based on the measurement of the circumference of a circle described with the vertex of the angle as its center. The circumference is regarded as divided into 360 equal parts called *degrees*; a right angle is thus the angle subtended at the center by the fourth part of the circumference, or is 90 degrees. The table is:

60 seconds (60")	= 1 minute (1')
60 minutes	= 1 degree (1°)
360 degrees	= 1 circle or circumference.

**Apothecaries' measure**, the system of units employed by apothecaries in compounding and dispensing liquid drugs. The table is in use in the United States is:

Gallon.	Pints.	Fluidounces.	Fluidrachms.	Momms.
1	= 8	= 128	= 1024	= 65536
1	= 16	= 128	= 7680	
	1	= 8	= 480	
		1	= 60	

The capacity of the gallon is 231 cubic inches. The pint of the British Pharmacopoeia (being the eighth part of the gallon of 277.274 cubic inches) is divided into 20 fluidounces, with the fluidrachm and minims constituting the same subdivisions of the fluidounce as in the above table. The cubic capacity of the gallon can, however, be stated only approximately. The standards are made to contain a certain weight of water at a certain temperature. See *gallon*.

	1	= 4	= 9
		1	= 2 1/4

The English ell is 5 quarters, and the Flemish ell about 3 quarters. See *ell*. —**Common measure.** See *common*. —**Compound measure.** See *compound*. **Cubic measure**, the system of units employed for measuring volume, formed from long measure by taking the cubes of the lineal dimensions. The table is:

1	= 27	= 46656
	1	= 1728

**Decimal measure.** See *decimal*. **Dry measure**, the system of units ordinarily used in measuring dry commodities, such as grain, fruit, etc. The table is:

Quarter.	Bushels.	Pekels.	Gallons.	Quarts.	Pints.
1	= 8	= 32	= 64	= 256	= 512
	1	= 4	= 8	= 32	= 64
		1	= 2	= 8	= 16
			1	= 4	= 8
				1	= 2

A pottle is 2 quarts; a load of grain is 5 quarters, and a last 10 quarters. The approximate capacity of the imperial (British legal) bushel is 2,218.192 cubic inches; of the Winchester (United States legal) bushel, 2,150.42 cubic inches. (See *apothecaries' measure*.) The United States bushel is thus equivalent to .96946 British bushel. —**Gravitation measure of force.** See *gravitation*. —**Greatest common measure** of two or more numbers or quantities, the greatest number or quantity which divides each of them without a remainder. —**Heaped measure.** See *heaped*. —**Imperfect measure.** See *imperfect*. —**In a measure**, to some extent. —**Lineal or linear measure.** See *lineal measure*, below. —**Liquid measure**, the system of units ordinarily used in measuring liquids. The table is:

Gallon.	Quarts.	Pints.	Gills.
1	= 4	= 8	= 32
	1	= 2	= 8
		1	= 4

For the capacity of the gallon, see *apothecaries' measure*.

**Long measure, lineal or linear measure**, the system of units ordinarily used in measuring length. The table is:

Mile.	Furlongs.	Poles, Rods, or Perches.	Yards.	Feet.	Inches.
1	= 8	= 320	= 1760	= 5280	= 63,360
	1	= 40	= 220	= 660	= 7,920
		1	= 10	= 16 1/2	= 198
			1	= 3	= 36
				1	= 12

Other units considered as belonging to long measure are the pace, 5 feet; the fathom, 6 feet; the span, 9 inches; the hand (used in measuring the height of horses), 4 inches; the surveyors' chain or Gunter's chain, of 100 links, each of 7 1/2 inches; the engineers' chain, of 100 links (United States), 100 feet (see *link*). (See *land measure*.) The acre is 10 square fathoms, or 100,000 square links. **To take the measure of**, to observe narrowly so as to form a judgment concerning. **Winchester measure.** See *bushel*, 1. **Within measure**, within bounds. **With measure**, fully.

He cannot but *with measure* fill the honours

Which we devise him. Shak., Cor., II, 2, 127.

To ascertain the length, extent, dimensions, quantity, or capacity of by comparison with a standard; ascertain or determine a quantity by exact observation. To measure a length, a standard of length is employed; this is laid down so that its beginning coincides with the beginning of the length to be measured, and its other end is marked; it is then laid down again in the same way, with its first end where its last end previously came, and so on, counting the number of times it is laid down. Finally, if there remains a length less than that of the standard, this is measured by subdividing the length of the standard into a sufficient number of equal parts, and using one of these as a secondary standard. Measurements are also effected by reference to units of area or of capacity, as well as by means of weighing, etc.

The word is also sometimes used to designate coins, particularly ancient coins in the precious metals, or fine medieval or Renaissance coins, in collections. Some of the Greek and Roman coin-types are commemorative, and the Roman medallions were of a quasi-medallic character. Strictly speaking, however, the medal is a creation of modern times. The earliest, and in point of portraiture the finest, medals were produced in Italy about the middle of the fifteenth century by Vittore Pisano of Verona. Fine medals were also executed in Italy, Germany, and France during the sixteenth century. English medals begin practically with the reign of Henry VIII. The earliest specimens are cast, but in the reign of James I. the process of striking began to be employed. Thomas Rawlins, Thomas Simon, and Abraham Simon (seventeenth century) are the principal medalists who were natives of England; but some of the best English medals were the productions of foreign artists, as Trezzu (time of Philip and Mary), Simon Passe (James I.), N. Briot (Charles I.), the Roettier family (Charles II.), and J. Croker (Anne).

An antique *medal*, half consumed with rust.

Baile, Works, V. 545.

Italian and French writers of the fifteenth and sixteenth centuries use *medaglio* and *medaglia* to signify coins which, being no longer in circulation, were preserved in the cabinets of collectors as curiosities. Even in the last century our own word *medal* was so employed. The *medals* of the Roman Emperors to which Gibbon often alludes in his notes to the "Decline and Fall" are, of course, what are now known as coins; and Addison's "Dialogue upon the Usefulness of Medals" is, for the most part, a treatise on Roman imperial coins.

**medal-cup** (med'al-kup), *n.* A drinking-vessel of metal, usually silver, in which coins or medallions are incrustated and form a part of the decoration. In some cases a series of coins of a single sovereign or of a succession of sovereigns is used.

**medalet** (med'al-et), *n.* [*< medal + -et*.] Any medal of small size. When not larger than, for example, the English florin or half-crown, or United States half-dollar, medals are generally called by this name; but numismatists do not make any rigid distinction between medals and medalets.

I shall beg leave to give this class the appellation of *medalets*, as the genus of our language admits of this diminutive in ringlet, bracelet, and the like.

**1.** To make mediate; reduce from an immediate or direct to a mediate or indirect relation through the interposition of a secondary superior or controlling agency. Applied specifically to the process of converting one of the minor German states or princely families of the old empire from the semi-independent condition of having a direct share in the imperial government, and responsibility to it, to that of subordination to an intervening power, by being annexed to it while retaining all local possessory and governmental rights. By this process, especially under the Westphalian treaties of 1648, and the changes leading to the dissolution of the old empire and the formation of the Confederation of the Rhine in 1806, the number of mediatized states and princely families became very large.

The same peace [that of Lunéville] declared that all the secular princes who had lost territory by this cession were to be indemnified by the Empire. This was done at Regensburg in 1803. See *ent* under *aculeph.* [In this sense there is no plural.] (c) [*l. c.*] Some hydrozoan resembling or supposed to be one of the foregoing; a medusoid: as, the naked-eyed *medusa* of Forbes, which are the reproductive zooids or gonophores of gymmobarastic hydroids.

The nectocalyx is furnished with a system of canals, and a number of tentacles depend from its margin. The reproductive organs appear as processes either of the sides of the polypite or of the nectocalyxine canals. It is manufactured into tobacco-pipes, which, after being carved or turned, are baked to dry them, then boiled in milk, polished, and finally boiled in oil or wax. Artificial meerschäum is made from the chips and waste left from meerschäum-cutting, consolidated by pressure.

Meerschäum is imitated also in plaster of Paris, treated with paraffin and colored with gamboge and dragon's blood, and in other ways.

But the bank may pay it like any other check if presented. A *memorandum* is simply a note made in order to prevent the forgetting of something important, especially something which might easily slip from the mind. *Memento* and *souvenir* differ very slightly, *souvenir* being a somewhat more elevated word; we give a book or a lock of hair as a *memento*; we prize a faded flower as a *souvenir* of a visit to Mount Vernon with friends now separated from us. *Memorial* and *monument* are sometimes the same; as, the *Martyrs' Memorial* at Oxford is essentially a *monument*. A *monument* is often a single shaft or column, as the *Washington monument*; a *memorial* may be a commemorative structure, an illuminated window, a book, etc.

=**Syn.** 1-4. *Memory*, *Recollection*, *Remembrance*, *Remi-  
 niscence*. *Memory* is the general word for the faculty or cap-  
 acity itself; *recollection* and *remembrance* are different  
 kinds of exercise of the faculty; *reminiscence*, also, is used  
 for the exercise of the faculty, but less commonly, and then  
 it stands for the least energetic use of it, the matter seem-  
 ing rather to be suggested to the mind. The correctness  
 of the use of *memory* for that which is remembered has  
 been disputed. The others are freely used for that which  
 is remembered. In either sense, *recollection* implies more  
 effort, more detail, and more union of objects in wholes,  
 than *remembrance*. *Reminiscence* is used chiefly of past  
 events, rarely of thoughts, words, or scenes, while *recollec-  
 tion* is peculiarly appropriate for the act of recalling men-  
 tal operations. See *remember*.

The system of notation included notes and rests called *large*, *maxima*, *long*, *breve*, *semibreve*, *minim*, *semi-minima*, *fusa*, and *scintilla* (*fusillo*), of which in general each note was equal in duration to either three or two of the next denomination, according to the *tempus* used. **Menuridae** (mē-nū'ri-dē), *n. pl.* [*NL., < Menura + -idae.*] An Australian family of anomalous or pseudoscimine passerine birds, represented by the genus *Menura*; the lyre-birds. It is one of two families (the other being *Atrichidae*) which, though belonging to the order *Passeres*, deviate from the normal passerine type in the structure of the vocal organs and in some other particulars, to such an extent that a separate division of the order has been established for their reception. (See *Menuridae* and *Pseudoscimines*.) The remarkable conformation of the tail of the male birds early attracted attention, and the size and general appearance of the birds caused them for many years to be considered as raptorial or gallinaceous, they being accordingly ranked with the mound-birds, curassows, and guans. Subsequently they were referred by some authors to the American family of rock-wrens (*Pteropodidae*). It is only of late years that a knowledge of the anatomical structure has enabled ornithologists to classify the family correctly.

It is characterized by a capsule which breaks open irregularly at the top into two partial valves, and by long petiolate radical leaves, which are trifoliate or round, reniform, and crenate. There are two species, or perhaps only one, *M. trifoliata*, the hog-bean, buck-bean, or marsh-trefoil. They are herbaceous water-plants, with a creeping rootstock, sheathed by the membranous bases of the long petioles, and bear white or bluish flowers, which grow in a raceme at the apex of a long leafless scape. It is distinguished by the loose coat of the seeds, the short gamopetalous corolla, and the 4- to 5-celled ovary. There are 7 species, natives of North America, Japan, and Kamchatka, shrubs with alternate petioled entire deciduous leaves, and small or medium-sized flowers in terminal racemes. One species, *M. globularis*, is found in the Alleghanies. The Irish heath, *Daboecia polifolia*, was formerly included in this genus.

**Mephistophiles** (mef-is-tō-fē-lēs), *n.* [*Written Mephistophilus in Shakspeare, Fletcher, etc.,*

*Mephistophilus* in Marlowe, but now generally *Mephistopheles*, as in Goethe; a made-up name, like most of the names of the mediæval devils. Whether the orig. concealer of the name meant to form it from *Gr. mē, not, + phos (phōs), light, + phōr, loving (a plausible etymology, though the formation is irregular), or from some other elements (some conjecture Gr. νεφ, a cloud, + phōr, loving), or merely concocted a Greek-seeming name of no meaning, must be left to conjecture.*] The name of a familiar spirit mentioned in the old legend of Sir John Faustus, and a principal agent in Marlowe's play of Dr. Faustus, and in Goethe's "Faust."

Then he may pleasure the king, at a dead pinch too

Without a Mephistophilus, such as thou art.

Fletcher, Wife for a Month, v. 1.

*Mephistophiles* . . . is the Spirit of Negation, and his being exists through opposition to the positive Truth, and Order, and Beauty, which proceed from the never ending creative energy of the Deity . . . His irreverence and irony are . . . a part of his nature.

E. Taylor, Faust, I., note 53.

**Mephitis** (mef-i-tis), *n. pl.* [*NL., < Mephitis + -ina.*] A subfamily of *Mustelidae* peculiar to America, typified by the genus *Mephitis*; the skunks. The group is closely related to the badgers or *Mellivore* and to the African *Zorillinae*, the three being combined by some authors. But the *Mephitis* are distinguished by having 2 or 4 more teeth in the lower than in the upper jaw, the back upper molar quadrate, and the premolars 3 above and below on each side (in one genus only 2 above on each side). The form is stout, with moderately developed limbs, unwebbed digits, and long bushy tail; the coloration is black and white; there is no subcaudal pouch as in badgers, but the perianal glands are enormously developed, secreting the fetid fluid which forms a means of defense and offense. The teeth are 33 in number, 16 above and 16 below. The pelage is very long, the tail long and very bushy, and the coloration black, striped or spotted with white. The palatine ends opposite the last molar; the mastoid process is large; the periotics are not much inflated; the zygoma rises backward, and the profile of the skull is highest over the orbits. The nostrils are lateral, and the soles hairy, at least in part. There are several species, of North and Central America, the best-known of which is *M. mephitis*, the common skunk. *M. macrura* is the long-tailed skunk of Mexico. The little striped skunk, *M. putorius* of the United States, is referred by Coles to the genus *Spilogale*. The South American and African skunks which have been referred to *Mephitis* belong to other genera. See *skunk*.

Of or pertaining to merchants, or the traffic carried on by merchants; having to do with trade or commerce; trading; commercial.

Bourgeois . . . was esteemed an adept in the mystery of mercantile politics. *Macaulay*, *Hist. Eng.*, vi.

2. Characteristic of the business of merchants; in accord with business principles.

It was found essential to establish the work [the "Edinburgh Review"] on a sound mercantile basis, with a paid editor and paid writers. *Smyth Smith*, *Wit and Wisdom*.

**Mercantile law**, the laws applicable to commercial transactions; the law merchant. See *law merchant*, under *law*. — **Mercantile system**, in *polit. econ.*, the belief, generally held till the end of the last century, that all wealth consists in gold and silver, and that therefore the exportation of goods and importation of gold should be encouraged by the state, while the importation of goods and the exportation of gold should be forbidden, or at least restricted as much as possible.

While there are so many things to render the assumption which is the basis of the mercantile system plausible, there is also some small foundation in reason, though a very insufficient one, for the distinction which that system so emphatically draws between money and every other kind of valuable possession.

*J. S. Mill*, *Pol. Econ.*, Prelim. Rem.

Thus, the Mercantile System admits every mode of applying the three factors of production, but considers them really productive only in so far as they increase the quantity of the precious metals possessed by the nation, either through the agency of mining at home or by means of foreign trade.

*W. Roscher*, *Pol. Econ.* (trans.), i. 169.

= *Syn.* *Mercantile*, *Commercial*. *Commercial* is the broader term, including the other. *Mercantile* applies only to the actual purchase and sale of goods, according to one's line of business; the mercantile class in a community comprises all such as are actually in the business of buying and selling. *Commercial* covers the whole theory and practice of commerce, home or foreign; as, the British are a *commercial* people; *commercial* usages, honor, law. The word is applicable wherever the more varied activities of commerce are concerned.

**mercantilism** (mēr'kan-tīl-izm), *n.* [*< mercantile + -ism*.] 1. The mercantile spirit or character; devotion to trade and commerce; excessive importance attached to traffic, or to exchange of values in any way.

*Mercantilism* is drawing into its vortex the intellectual strength of the nation. *The Century*, XXXI. 311.

2. In *polit. econ.*, the mercantile system, or the theories embodied in it. See *mercantile*.

Indeed, it has been justly observed that there are in him [Hume] several traces of a refined mercantilism, and that he represents a state of opinion in which the transition from the old to the new views is not yet completely effected.

It was he who guided the shades of the dead to their final abiding-place. He is represented in art as a young man, usually wearing a winged hat and the talaria or winged sandals, and bearing the caduceus or pastoral staff and often a purse.

5. The innermost planet of the solar system. Its mean distance from the sun is 0.387 that of the earth. The inclination (7 degrees) and the eccentricity (0.2056) of its orbit are exceeded only by some of the minor planets. Its diameter is only 3,000 miles, or about  $\frac{1}{2}$  of that of the earth; its volume is to that of the earth as 1 to 18.5. It performs its sidereal revolution in 88 days, its synodical in 116. Its proximity to the sun prevents its being often seen with the naked eye. The mass of Mercury, though as yet not very precisely determined, is less than that of any other planet (asteroids excepted). According to Schiaparelli it rotates on its axis in the same way as the moon does, once in each orbital revolution.

6. [*l. c.*] Chemical symbol, Hg; atomic weight, 200.1. A metal of a silver-white color and brilliant metallic luster, unique in that it is fluid at ordinary temperatures. It becomes solid, or freezes, at about -40°, and crystallizes in the isometric system. Its specific gravity at 0° is 13.6; when frozen, according to J. W. Mallet, 14.1932. This metal occurs native, sometimes in considerable quantity; but by far the largest supply is obtained from the sulphid, known as *cinnabar*. (See *cinnabar*.) Mercury is not very generally disseminated. In the United States only traces of its ores have been found to the east of the Cordilleras. The principal sources of supply are the mines of Almaden in Spain, of New Almaden and others near the Bay of San Francisco, and of Idria in Austria. Its chief use is in the metallurgical treatment of gold and silver ores by amalgamation. The thermometer and barometer are instruments in which the peculiar qualities of this metal are well illustrated. Commercially the most important salts of mercury are mercurous chloride ( $\text{Hg}_2\text{Cl}_2$ ) or calomel, chiefly used in medicine, and the mercuric chloride ( $\text{HgCl}_2$ ) or corrosive sublimate, a violent poison used in medicine and extensively in surgery as an antiseptic, and as a preservative in dressing skins, etc., being a very powerful antiseptic. The sulphid ( $\text{HgS}$ ) or cinnabar, when prepared artificially, is called *vermillion*, and is used as a pigment. The names *mercury* and *quicksilver* are entirely synonymous, but the former is rather a scientific designation, and one necessarily used in compound names and in the adjective form; while the latter is a common popular designation of this metal. See *amalgam, calomel, quicksilver*.

7. [*l. c.*] The column of quicksilver in a thermometer or barometer, especially with reference to the temperature or state of the atmosphere shown by it. [Colloq.]

The descending drops of mercury carry with them portions of the air or other gas from the receiver, and if the process is long continued, the supply vessel at the top being kept full, a nearly perfect vacuum may be obtained. This form of air-pump is often called a *Sprengel pump*. It gives a much higher degree of exhaustion than is possible with the ordinary mechanical air pump, and is much used not only in physical experiments but also for practical purposes, for example in removing the air from the glass bulbs of the incandescent electric lamps.—**Mount of Mercury, in palmistry.** See *mount*, 1, 6.—**Native or virgin mercury**, the pure metal found in the form of globules in cavities of the ores of this metal.—**Three-seeded mercury**, a plant of the genus *Acalypha*, of the same family as *Mercurialis*, and more or less similar in appearance.
